

**FDA Report on the
Occurrence of Foodborne Illness Risk Factors
in Selected Institutional Foodservice,
Restaurant, and Retail Food Store Facility Types
(2004)**

Prepared by the FDA National Retail Food Team

ACKNOWLEDGEMENTS

The following individuals and/or entities are to be recognized for their invaluable contributions to the development of this report and the implementation of this project:

FDA:

Center for Food Safety and Applied Nutrition (CFSAN)

Jerome Schneidman, Division of Mathematics
Marc Boyer, Division of Mathematics
Margaret Boone, Division of Cooperative Programs

Office of Regulatory Affairs (ORA)

Regional Retail Food Specialists
Robert Brands, Division of Federal – State Relations (DFSR)
Kevin Smith, DFSR

National Retail Food Steering Committee

Richard Barnes, ORA, Director of DFSR, Committee Chair
Faye Feldstein, CFSAN, Office of Compliance, Director of Division of Cooperative Programs
Glenda Lewis, CFSAN, OC/DCP/Retail Food Protection Team (NRFPT), Team Leader,
Shirley Bohm, CFSAN, OC/DCP/RFPT, team representative
Linda Collins, ORA, Regional Retail Food Specialist, field team representative
John Powell, ORA, Regional Retail Food Specialist, field team representative
Jim Fear, ORA, Manager State Training, Division of Human Resource Development (DHRD), DHRD team representative

OTHER REGULATORY:

State and local regulatory jurisdiction representatives who accompanied the FDA Regional Food Specialists on data collection inspections.

INDUSTRY:

Industry food service managers of selected participant establishments for their cooperation and assistance during the data collection.

EXECUTIVE SUMMARY

In 1998, the U.S. Food and Drug Administration's (FDA) National Retail Food Team initiated a study to measure the occurrence of food preparation practices and employee behaviors most commonly reported to the Centers for Disease Control and Prevention (CDC) as contributing factors in foodborne illness outbreaks. Specifically, this study called for conducting data collection inspections of various types of foodservice and retail food establishments at five-year intervals to observe and document the occurrence of the following contributing factors:

- Food from Unsafe Sources
- Improper Holding/Time and Temperature
- Inadequate Cooking
- Poor Personal Hygiene
- Contaminated Equipment/Prevention of Contamination

For the purposes of this long-term study, FDA designates these contributing factors as "foodborne illness risk factors."

The first report in the study was issued in August 2000 and presented data collected in 1998. This 2004 report is the second report in the series and presents data collected in 2003. A third data collection is scheduled for 2008.

The 2000 report called attention to the need for greater active managerial control of foodborne illness risk factors. It suggested that more innovative and effective strategies to improve food safety practices in retail and foodservice establishments were needed. The report highlighted operational areas most in need of improvement including employee handwashing, cold holding of potentially hazardous foods, date marking of ready-to-eat foods, and cleaning and sanitizing of food contact surfaces.

In 2003, FDA Regional Retail Food Specialists collected data during site-visits of over 900 establishments representing nine distinct facility types. Direct observations, supplemented with information gained from discussions with management and food workers, were used to document the establishments' compliance status for forty-two individual data items based on provisions in the *1997 FDA Food Code*. In each establishment, the compliance status for each data item was recorded in terms of IN Compliance, Out of Compliance, Not Observed (meaning the behavior or practice was not observed during the visit), or Not Applicable (meaning the behavior or practice did not apply to the establishment).

For each of the nine facility types, the percentage of observations recorded as Out of Compliance is presented for each risk factor and for the individual data items related to those risk factors most in need of priority attention. The Percent Out of Compliance value for each risk factor was calculated by dividing the total number of Out of Compliance observations of data items in the risk factor by the total number of

observations (IN compliance and Out of Compliance) of data items in the risk factor. The Percent Out of Compliance for an individual data item is the proportion of establishments where that data item was Out of Compliance when the practice or procedure could be observed.

The data presented in this report indicate that the same risk factors and data items identified as problem areas in the 2000 report remain in need of priority attention. This indicates that industry and regulatory efforts to promote active managerial control of these risk factors must be strengthened. In all facility types, the Out of Compliance percentages remained high for data items related to the following risk factors:

- Improper Holding/Time and Temperature
- Poor Personal Hygiene
- Contaminated Equipment/Prevention of Contamination

For the improper holding/time and temperature risk factor, the high Percent Out of Compliance values were most commonly associated with improper cold holding of potentially hazardous food (PHF) and inadequate date marking of refrigerated ready-to-eat PHF.

Within the poor personal hygiene risk factor, the proper, adequate handwashing data item had the highest Percent Out of Compliance value for every facility type. Percent Out of Compliance values for proper, adequate handwashing ranged from approximately 34% for hospital foodservice to approximately 73% for full service restaurants.

Of the data items related to the contaminated equipment/protection from contamination risk factor, improper cleaning and sanitizing of food contact surfaces before use was the item most commonly observed to be Out of Compliance in each facility type. Percent Out of Compliance values for this data item ranged from 25% in elementary schools to 58% in deli departments.

This report also includes a comparison between the data collected from food establishments that had a Certified Food Protection Manager (CFPM) from a program recognized by the Conference for Food Protection and those that did not. The data suggests that the presence of a certified manager has a positive effect on the control of certain risk factors, especially in fast food restaurants, full service restaurants, meat and poultry departments, and produce departments. Poor personal hygiene appears to be the risk factor for which the presence of a certified manager had the most positive effect.

The 2003 data collection effort included several supplemental data items that were not included in the 1998 data collection. While the forty-two primary data items in the study remained the same from 1998 to 2003, the supplemental data items addressed changes made to the *FDA Food Code* since 1998. These items related to the cooking temperature for pork, minimum hot holding temperatures, employee health, juice, eggs,

and highly susceptible populations. Data gathered for the supplemental data items suggest that reducing the minimum hot holding temperature for potentially hazardous foods from 140 °F (60 °C) to 135 °F (57 °C) and reducing the minimum cooking temperature for pork from 155 °F (68 °C) to 145 °F (63 °C) had minimal effect on the industry's control of these risk factors.

Results from the 2003 data collection indicate that the recommendations made to foodservice and retail food operators and regulators in the 2000 Report need to be reemphasized. Foodservice and retail food operators must ensure that their management systems are designed to achieve active managerial control over the risk factors. Likewise, regulators must ensure that their inspection, education, and enforcement efforts are geared toward the control of the risk factors commonly found to be Out of Compliance.

I. INTRODUCTION AND PURPOSE

A. Background

Ensuring safe food is an important public health priority for our nation. For years regulatory and industry food safety programs have focused on reducing the incidence of foodborne illness. Despite these efforts, the 1996 report “Reinventing Food Regulations” [National Performance Review] concluded that *foodborne illness caused by harmful bacteria and other pathogenic microorganisms in meat, poultry, seafood, dairy products, and a host of other foods is a significant public health problem in the United States.*

The National Performance Review Report looked at the occurrence of foodborne illness from a farm-to-table perspective. It did not attempt to define the scope of the problem within specific sectors of the farm-to-table continuum. In order to determine the effectiveness of regulatory and industry food safety programs within foodservice and retail food store facility types, a study was needed that would assess information associated with the occurrence of foodborne illness and be specific to this segment of the industry.

FDA’s Response to the 1996 National Performance Review Report

In response to the 1996 National Performance Review Report and subsequent input from state and local regulatory partners, FDA established the National Retail Food Steering Committee (Steering Committee) including representation from the Center for Food Safety and Applied Nutrition (CFSAN), Office of Regulatory Affairs (ORA), Division of Federal/State Relations (DFSR), Division of Human Resource Development (DHRD), and the Interstate Travel Program (ITP) Field Team. The Steering Committee is responsible for reviewing retail food program objectives and coordinating program activities.

The 1993 Government Performance and Results Act required Federal agencies to develop performance plans that included measurable goals and performance indicators. To establish a strategic direction for the retail food program, the Steering Committee made it a priority to identify a performance measurement to assess the effectiveness of the nation’s retail food protection system. The initiatives in the subsequent strategic plan are directed toward developing a national retail food program model that can be used by federal, state, local, and tribal regulatory agencies to:

- Identify essential food safety program performance measurements;
- Assess strengths and gaps in the design, structure, and delivery of program services;
- Establish program priorities and intervention strategies focused on reducing the occurrence of foodborne illness risk factors; and
- Create a mechanism that justifies program resources and allocates them to program areas that will provide the most significant public health benefits.

Identifying Performance Measures for Regulatory Retail Food Programs

Although the level of foodborne illness would be the ideal retail food program performance indicator, the occurrence of foodborne illness is grossly underreported. This makes the incidence of foodborne illness an unreliable program measurement. As an alternative, the occurrence of foodborne illness risk factors was selected as the performance indicator. The *Centers for Disease Control and Prevention (CDC) Surveillance Report for 1988 – 1992* identified the food preparation practices and behaviors most often associated with foodborne illness outbreaks. These reported contributing factors relate to food safety concerns within foodservice and retail food store facility types and include:

- Food from Unsafe Sources
- Inadequate Cooking
- Improper Holding Temperatures
- Contaminated Equipment
- Poor Personal Hygiene

For the purposes of this long-term study, FDA designated these five categories of contributing factors as “foodborne illness risk factors.” Note that this use of the term “risk factor” should not be confused with another use of the same phrase to describe characteristics of the person, food or location that are statistically linked to illness by an epidemiological investigation. Using the results from the 1998 data collection as a baseline, the Steering Committee has established a goal of *reducing the Out of Compliance percentage of observations of the original forty-two data items related to foodborne illness risk factors in institutional foodservice, restaurants, and retail food establishments by 25% by 2010.*

Study Timeline

Any study designed to measure trends requires analysis of the subject matter over a period of time. No single point in time can be used to derive conclusions. Rather, it is a review and evaluation of the data collected at several intervals that provide the basis for drawing conclusions.

This project was designed to collect data on the occurrence of the foodborne illness risk factors in selected foodservice and retail food establishments at five-year intervals. These data collection efforts are designed to get an accurate picture of the extent to which foodservice and retail food operations have control over the risk factors during each data collection period. Using the data from multiple collection periods, FDA hopes to evaluate trends and determine whether progress is being made toward the goals of reducing the occurrence of foodborne illness risk factors.

In order to detect trends of improvement and/or regression in this study, it is necessary to collect data from at least three, and preferably more, periods in time.

Table 1

Study Timeline

Data Collection Period	Title of the Report	Project Objectives
1998	<i>Report of the FDA Retail Food Program Database of Foodborne Illness Risk Factors. Published in 2000</i>	Establish a Baseline for nine selected institutional foodservice, restaurant, & retail food store facility types
2003	<i>FDA Report on the Occurrence of Foodborne Illness Risk Factors within Selected Institutional Foodservice; Restaurant & Retail Food Store Facility Types (2004)</i>	Identify risk factors and data items in need of priority attention. Collect 2 nd of at least three sets of data needed to assess trends in occurrence of risk factors.
2008	Target Report Date: 2009	Use the information from the three data sets to assess improvement/regression changes from the 1998 Baseline

1998 Study Established the First National Baseline

Using the results of the 1998 data collection, the 2000 *Report of the FDA Retail Food Program Database of Foodborne Illness Risk Factors* established the first-ever national baseline on the occurrence of foodborne illness risk factors within institutional foodservice, restaurant, and retail food store facility types. By establishing a baseline, regulatory and industry food safety professionals have a performance measure upon which to assess the impact of efforts directed to positively change behaviors and practices related to foodborne illness.

The data in Table 2 presents the IN Compliance status of forty-two data items used to establish the 1998 Baseline measurements and the FDA 2010 improvement goal for each of the nine facility types included in the study. These measurements represent the “overall IN Compliance percentages” for each of the nine facility types.

Table 2

Percentage (%) of Observations found IN Compliance for ALL Data Items

Industry Segment	Facility Type	1998 Baseline* % IN Compliance for Observations made of ALL data items (rounded to nearest %)	2010 FDA Improvement Goal** (rounded to nearest %)
Institutions	Hospital	80%	85%
	Nursing Home	82%	87%
	Elementary School	80%	85%
Restaurants	Fast Food	74%	81%
	Full Service	60%	70%
Retail Food	Deli	73%	80%
	Meat & Poultry	81%	86%
	Seafood	83%	87%
	Produce	76%	82%

***1998 Baseline calculation:**

Percent IN Compliance =

$$\frac{\text{All applicable, observable, IN Compliance data items within all risk factor categories}}{\text{Total number of observations (IN and OUT)}} \times 100\%$$

**To be consistent with the Retail Food Steering Committee’s established performance goal, a ten-year goal of 25% reduction for the Percent Out of Compliance was set as the target for improvement. An example computation using Hospitals illustrates how the specific ten-year improvement goal percentages were attained:

Hospital: 1998 Baseline % = 80% IN Compliance (20% Out of Compliance)
Improvement goal = 25% reduction in the Percent Out of Compliance

$$25\% \text{ of } 20\% = 5\%$$

$$\text{Baseline Out of Compliance } 20\% - 5\% = 15\%$$

Improvement goal = 85% IN Compliance

2003 Study should be interpreted as a separate stand alone report

The *FDA Report on the Occurrence of Foodborne Illness Risk Factors in Selected Institutional Foodservice, Restaurants and Retail Food Facility Types (2004)* summarizes results from the second data collection conducted in 2003. The results contained in this report provide insight into the effectiveness of industry management systems and food safety regulatory programs in controlling foodborne illness risk factors in certain retail and foodservice operations. This report should be read and the data interpreted as a separate stand-alone report. Additional data are needed before any meaningful assessments of trends can be made for each of the facility types. This report makes no attempt to draw comparisons between the results of the 1998 and 2003 data collections.

2008 Study will begin the process for assessing risk factor changes

A third data collection is planned for 2008. Having data from three separate years over a ten-year span should shed light on whether changes in the occurrence of risk factors in foodservice and retail food establishments are taking place.

B. Study Design and Objectives

This study contains nine separate baselines, one for each of the nine different facility types. The target industry segments for this project are institutional foodservice, restaurants, and retail food stores. Of the nine facility types, three were associated with institutional foodservice – hospitals, nursing homes, and elementary schools (K – 5). The restaurant industry segment was comprised of two facility types – fast food and full service. Four facility types were departments of retail food stores and independent specialty operations related to deli, meat and poultry, seafood, and produce.

Although the data presented were collected from many locations across the U.S., this study was not designed to support comparisons of states, counties, cities, or even regions of the U.S. Not only would it be inappropriate from a statistical standpoint, but such comparisons might be combined with other information, such as the location of FDA Regional Retail Food Specialists, to identify some of the establishments eligible for random selection in future studies. This information would bias later data collection efforts.

The data from this project provided input into the Healthy People 2010 Initiative under Food Safety Objective 10.6. This objective is designed to improve food preparation practices and food employee behaviors within institutional food service establishments, restaurants, and retail food stores.

C. Introduction

Guidance for Interpreting the Results in this Report

All statistical studies have limitations. How a research project is designed and implemented can have a profound impact on the interpretation of the data.

Prior to discussing methodology and data results, it is essential to review what the 2003 study has been designed to do and, equally important, what it is NOT designed to do. Without this discussion, the data presented may quite easily be misinterpreted or used inappropriately.

This study was designed using assessment criteria based on the 1997 FDA Food Code

The project is designed to track the foodservice and retail food industries' control of foodborne illness risk factors using specific requirements in the *1997 FDA Food Code*. Since one of the purposes of the project is to track changes in the Percent IN Compliance of observations related to industry's efforts to control foodborne illness risk factors, the standard of measurement used to evaluate these comparisons must remain constant for each of the data collection periods (1998, 2003, and 2008). For example, suppose the recommended standard in the Food Code was relaxed and we changed the data item accordingly. If the compliance percentage is then found to increase, we would not know if this was due to better employee practices or simply the change in the recommended standard.

The data collection inspection form used for this report (pages 17 to 25) contains two sections. Forty-two individual data items comprise the first section of the form. Each of the data items is listed under one of the foodborne illness risk factors. These forty-two data items will remain the same for all three data collection periods (1998, 2003, and 2008).

Since 1997, the *FDA Food Code* has been updated several times. A second section has been included on the data collection inspection form under the title, "Supplemental Items," to assess the impact of changes made in the *1997 FDA Food Code* on IN Compliance percentages for foodborne illness risk factors and data items. The design of the data collection inspection form ensures a means to track changes over time against a constant standard of measure and provides a mechanism for evaluating the potential impact of changes in *Food Code* provisions on the data collected.

Only a couple of individual data items within the study contain criteria or critical limits that have been updated since the release of the *1997 FDA Food Code*. A comparative assessment was conducted on what impact, if any, these changes in the *Food Code* had on the overall IN compliance percentages. The results and discussion of these data items are presented in Section VI, New Areas of Study – Supplemental Data Items.

The study was not designed to measure regulatory compliance with specific state or local Food Codes

The forty-two data items used to track changes in the occurrence of foodborne illness risk factors were based on the provisions within the *1997 FDA Food Code*. No attempt was made to determine if an establishment would have been found to be substantially IN Compliance with prevailing state, local, or tribal regulations.

The *FDA Food Code* is neither federal law nor federal regulation and is not preemptive of state, local, or tribal food safety requirements. In many cases, the *FDA Food Code* and prevailing regulatory standards of measurement were the same.

For some data items, the standard of measurement was different. Foodservice industry practices observed by the Specialists may have been IN Compliance with less stringent state or local laws even though the report notes they were not IN Compliance with the *1997 FDA Food Code*. Differences in state and/or local requirements have no bearing on the findings in this study since the *1997 FDA Food Code* was the assessment criterion. By using the *1997 FDA Food Code* as the standard of measurement, the study employed a single document of foodservice and retail food safety standards that have undergone national review.

This study was designed to assess industry management systems essential to the control of foodborne illness risk factors

In the 1998 and 2003 FDA data collections, observations were made for multiple data items (*FDA Food Code* requirements) that comprise food safety practices and employee behaviors specific to each of the five risk factors. Some of these individual data items did not have a direct link to human illness, but were essential to the active managerial control of foodborne illness risk factors.

For example, improper handwashing, which falls under the Poor Personal Hygiene risk factor, is associated with the spread of pathogens. There is a direct link between improper handwashing and potential human illness. The Poor Personal Hygiene risk factor also included data items related to the availability of hand soap and sanitary towels/hand drying devices. The availability of hand soap and sanitary towels/hand drying devices, though not directly linked to human illness, is an essential component of the management system needed to ensure proper handwashing.

Each of the risk factors in this report included individual data items that had a direct link to human illness and/or industry management practices essential to their control. For instance, the retention of shellstock tags was included in the evaluation of food source and date marking of ready-to-eat potentially hazardous foods was part of an assessment of holding temperatures.

An additional category, "Other," was included to capture potential food safety risks related to possible contamination by toxic or unapproved chemicals for each of the facility types.

This study was designed to focus only on a specific point in the farm-to-table food safety continuum

Pathogens may enter the food supply at any point in the farm-to-table food safety continuum. All industry sectors within this continuum have a responsibility for ensuring safe food.

The 2003 report covered only facility types that comprise institutional foodservice, restaurant, and retail food store operations. The report does not attempt to assess the

occurrence of foodborne illness risk factors within other sectors of the food industry or in private homes.

Consumers may find the information in this report useful when trying to better understand food safety risks. This report, however, does not provide specific information about the relative risks associated with the many options consumers have when it comes to dining and purchasing food.

Specific retail food safety information is available to consumers from a number of sources including public web sites maintained by federal, state, and local regulatory agencies, universities, consumer organizations, as well as, the foodservice and retail food industries. One such federal food safety site is www.foodsafety.gov.

Study Design Summary

This study is intended to fill a void that currently exists in the assessment of program effectiveness for controlling foodborne illness risk factors. It identifies the most urgent priorities for improvement. The following table provides a summary of the purpose and objectives of the ten-year study.

Table 3

Study Design Objectives

	The Study IS NOT Designed to
Measure trends over time in regulatory & industry efforts to reduce the occurrence of foodborne illness risk factors	Support comparisons of geographic areas, states, counties, cities or chains of foodservice/retail food store operations
Assess the occurrence of foodborne illness risk factors and management practices essential to their control in selected institutional foodservice, restaurant and retail food facility types	Assess the occurrence of foodborne illness risk factors in other industry sectors of the farm-to-table continuum
Use the <i>1997 FDA Food Code</i> provisions as the standard of measurement upon which to make observations of employee practices & behaviors	Determine an establishment's regulatory compliance with prevailing state, local, or tribal regulations
Identify employee practices and behaviors that contribute to the occurrence of foodborne illness that are in need of priority attention	Correlate the occurrence of foodborne disease risk factors with actual incidences of human illness

II. METHODOLOGY

In order to detect trends of improvement and/or regression from the 1998 baseline measurements, it is critical that the methodology used to collect data, as well as the study design, remain consistent for every data collection. For the 2003 data collection period, supplemental data items have been added to capture additional information not collected in 1998. The following sections of the report will present an overview of the methodology used in this study as originally designed in 1998. In addition, unique elements to the 2003 data collection (i.e. supplemental data items) are described.

A. Selection of Facility Types

For this study, nine facility types were chosen from three different segments of the foodservice and retail food industry.

INSTITUTIONAL FOODSERVICE

- Hospitals
- Nursing Homes
- Elementary Schools

RESTAURANTS

- Fast Food Restaurants
- Full Service Restaurants

RETAIL FOOD STORES

- Deli Departments
- Meat and Poultry Departments
- Seafood Departments
- Produce Departments

The selected institutional foodservice, restaurant and retail food store facility types included in this project represent over a million varied and diverse types of operations in the United States.

A direct focus on these industry segments allows FDA to track trends in the occurrence of foodborne illness risk factors in the vast majority of establishment types at the retail level that serve both general and highly susceptible populations. For the purposes of this report, a highly susceptible population was a group of persons who are more likely than the general population to experience foodborne disease due to their current health status or age.

B. Eligibility of Establishments for Selection

In determining the pool of establishments eligible for selection, an effort was made to exclude operations that handle only pre-packaged food items or conduct low-risk food preparation activities.

Establishments that were selected included moderate to high-risk operations, such as establishments that:

- Served a highly susceptible population (i.e., hospitals, nursing homes, elementary schools);
- Handled ingredients extensively; or
- Conducted a variety of food preparation processes.

Annex 4 of the 1997 FDA Food Code contains a suggested protocol for grouping establishments by risk. The following Risk Categorization of Food Establishments summary provided a general guideline for determining the type of establishments included in the study

Table 4

Risk Categorization of Food Establishments

RISK TYPE	RISK TYPE CATEGORY DESCRIPTION
1	Pre-packaged, non-potentially hazardous foods only. Limited preparation of non-potentially hazardous foods only.
2	Limited menu (1 or 2 main items). Pre-packaged, raw ingredients are cooked or prepared to order. Retail food operations exclude deli or seafood operations departments. Raw ingredients require minimal assembly. Most products are cooked/prepared and served immediately. Hot and cold holding of potentially hazardous foods is restricted to single meal service. Preparation processes requiring cooking, cooling, and reheating are limited to 1 or 2 potentially hazardous foods.
3	Extensive handling of raw ingredients. Preparation process includes the cooking, cooling, and reheating of potentially hazardous foods. A variety of processes require hot and cold holding of potentially hazardous food. Advance preparation for next day-service is limited to 2 or 3 items. Retail food operations include deli and seafood departments. Establishments doing food processing at retail.
4	Extensive handling of raw ingredients. Preparation processes include the cooking, cooling, and reheating of potentially hazardous foods. A variety of processes require hot and cold holding of potentially hazardous foods. Food processes include advanced preparation for next-day service. Category would also include those facilities whose primary service population is immunocompromised.
5	Extensive handling of raw ingredients. Food processing at the retail level, e.g., smoking and curing, reduced oxygen packaging for extended shelf-life.

The vast majority of selected establishments fell into risk categories 3 - 5 based on their operational practices and populations served. Due to limited food preparation or handling, some meat, seafood, and produce departments in retail food stores may have been risk category 2. These facility types were included in this study because foodborne illness outbreaks have been associated with certain products sold in these departments.

C. Selection of Data Collectors

Approximately twenty FDA Regional Retail Food Specialists (Specialists) located throughout the nation, were chosen as the data collectors for this study. Each Specialist possessed technical expertise in retail food safety and a solid understanding of the operations inherent to each of the nine facility types chosen. In addition, Specialists were standardized in the consistent and uniform application of the control measures in the *FDA Food Code* and possessed a strong working knowledge of the foodborne illness risk factors. Selection of the Specialists as data collectors strengthened consistency and uniformity in assessing employee behaviors and practices within their work environment. In addition, the Specialists comprised a group within which implementation of the project could be easily coordinated and standardized.

D. Selection of Geographical Locations

The geographical distribution of Specialists throughout the country allowed for a broad sampling of establishments throughout all regions of the U.S. The choice of data collection locations, therefore, was based on the Specialists' geographical areas of responsibility and provided a reasonably convenient design for estimating national risk-related behaviors and practices.

An improved design for measuring trends within the retail food industry would be one based on probability sampling of the whole nation in which the number of establishments inspected within any given location would be related to the volume of retail food consumed within that location. This would have required the development of comprehensive establishment lists for randomly selected locations around the country and excessive travel, which would have been cost-prohibitive and eliminated other vital work by FDA.

E. Selection of Establishments Using Comparison Set Establishment Lists

For the 1998 data collection period, each Specialist developed 5 Comparison Set Establishment Lists for each of the facility types. In most cases, each comparison set list was comprised of between 10 and 20 establishments located in a geographical area. For a few facility types, particularly nursing homes and hospitals, the number of establishments within a designated geographical area was limited. For these facility types, a comparison set list may have included as few as four establishments. Establishments were placed on each list in alphabetical order. In order to maintain data reliability and to ensure confidentiality of the selected establishments, the comparison set lists, as well as the inspectional observations, were retained in a central database by number rather than by establishment name or location.

Table 5 provides an illustration of a hypothetical Comparison Set Establishment List

Table 5

Comparison Set Establishment List

FDA Region	<i>Central</i>			
FDA Specialist	<i>Jane Doe</i>			
Industry Segment	<i>Restaurant</i>			
Facility Type	<i>Fast Food</i>			
Establishment Risk Category	<i>3</i>			
Comparison Set List Number	<i>List 1 of 5</i>			
Note: If a facility is randomly chosen, but not inspected, note the reason in the Notes section at the bottom of the page.				
			(Yes or No)	
Facility Name	Facility Address	Phone #	Random # Chosen?	Inspected?
1. <i>Anytime Food</i>	<i>1 Ocean Dr., Ocean Park, IL</i>	<i>123-4561</i>		
2. <i>Big Pizzas</i>	<i>23 Pizza Place, Pepperoni, IL</i>	<i>123-4562</i>		
3. <i>Crazy Time Food</i>	<i>101 Broadway, Ocean Park, IL</i>	<i>123-4563</i>	Yes	Yes
4. <i>Delicious Eats</i>	<i>240 Baltic Avenue, Monopoly, IL</i>	<i>123-4564</i>		
5. <i>Dig These Dogs</i>	<i>6437 Oak St., Pepperoni, IL</i>	<i>123-4565</i>		
6. <i>Hungry Horses</i>	<i>972 E. West St., Ocean Park, IL</i>	<i>123-4566</i>	Yes	Yes
7. <i>Make Your Own Sandwich</i>	<i>1 Elm St., Monopoly, IL</i>	<i>123-4567</i>		
8. <i>Tasty Treats</i>	<i>567 Illinois Ave, Monopoly, IL</i>	<i>123-4568</i>		
9. <i>Try R Food</i>	<i>1919 Park Place, Monopoly, IL</i>	<i>123-4569</i>		
10. <i>Zesty Delights</i>	<i>8134 W. East St., Ocean Park, IL</i>	<i>123-4570</i>	Yes	No
NOTES:				
<i>1998 – Establishment #6 randomly selected and inspected.</i>				
<i>2003 (1st Attempt) – Establishment #10 randomly selected but was closed for business.</i>				
<i>2003 (2nd Attempt) – Establishment #3 randomly selected and inspected.</i>				

In order to maintain consistency between data collection periods, the Specialists used the 1998 Comparison Set Establishment Lists in 2003 and will use them again in 2008. Selection bias was prevented by using a random number table to choose the establishments that were to be inspected. For example, using the hypothetical Comparison Set Establishment List, the Hungry Horses establishment was selected and inspected in 1998. In 2003, Zesty Delights was selected at random but was not inspected because it had gone out of business. Thus, the Specialist randomly selected another establishment from the list – Crazy Time Food.

Only one establishment was inspected from each comparison set list during the data collection. In addition, an establishment on a comparison set list could only be selected once for inspection. For instance, if in 2003, a Specialist randomly-picked an establishment that had already been inspected in 1998, the Specialist would have had to draw another random number until an establishment on the comparison set list that had not been inspected was chosen.

F. Number of Inspections Conducted

For statistical purposes at least ninety inspections were needed for each facility type. At least 100 inspections per facility type were planned to allow for un expected difficulties. In 2003, a total of 926 inspections, consisting of 15,516 observations, were conducted by FDA Regional Retail Food Specialists. Based on the number of inspections planned, each Specialist had to inspect at least five establishments from each of the nine facility types for a total of forty-five inspections.

G. Data Collection Form

So that data could be collected for *specific* behaviors and practices associated with each foodborne illness risk factor, the data collection form used for this study was divided into subparts. For example, rather than capturing all the behaviors and practices related to the Inadequate Cooking risk factor under one data item and being unable to discern what particular behavior or practice was at risk, there were twelve different types of observations that could be made, each corresponding to its own data item.

The data collection form used in 1998 included forty-two individual data items sorted among the five foodborne illness risk factors and a sixth category, "Other," for the potential risks related toxic or unapproved chemicals. Each of the forty-two data items were based on the *1997 FDA Food Code* for both data collection periods.

The *Food Code* has and will continue to be updated periodically during the ten-year span of the study. Some of the changes in the *FDA Food Code* relate to the original forty-two data items; others are new provisions used to address emerging food safety concerns. To capture data for these changes, an additional category, "Supplemental Data Items," was added to the data collection form in 2003. The requirements in the *2001 Food Code* were used as the basis for the Supplemental Data Items.

The following Data Collection Form was used for each establishment that was inspected:

BASELINE DATA COLLECTION FORM (page 1 of 9)

This form was drafted for the specific purpose of collecting data regarding the occurrence at the retail level of risk factors associated with foodborne illness outbreaks. It was/is not intended to serve as a comprehensive, Food Code-based inspection form for food establishments.

STATUS OF OBSERVATIONS:

- IN** = Item found IN Compliance (**IN Compliance** marking must be based on actual observations)
- OUT** = Item found Out of Compliance (**Out of Compliance** marking must be based on actual observations)
- NO** = Not observable (**NO** marking is made when the data item is part of the establishment's operation or procedures, OR is seasonal and is not occurring at the time of the inspection)
- NA** = Not applicable (**NA** marking is made when the data item is NOT part of the establishment's operation or procedures)

RISK FACTORS

****RISK FACTOR - FOODS FROM UNSAFE SOURCE****

FOOD SOURCE

STATUS **1. Approved Source**

- IN OUT** A. All food from Regulated Food Processing Plants/ No home prepared/canned foods
- IN OUT NA** B. All Shellfish from NSSP listed sources. No recreationally caught shellfish received or sold
- IN OUT NA NO** C. Game, wild mushrooms harvested with approval of Regulatory Authority

BASELINE DATA COLLECTION FORM (page 2 of 9)

STATUS 2. Receiving / Sound Condition

IN OUT A. Food received at proper temperatures/ protected from contamination during transportation and receiving/food is safe, unadulterated

STATUS 3. Records

IN OUT NA NO A. Shellstock tags/labels retained for 90 days from the date the container is emptied

IN OUT NA NO B. As required, written documentation of parasite destruction maintained for 90 days for Fish products

IN OUT NA C. CCP monitoring records maintained in accordance with HACCP plan when required

****RISK FACTOR-INADEQUATE COOK****

PATHOGEN DESTRUCTION

STATUS 4. Proper Cooking Temperature Per Potentially Hazardous Food (PHF). (NOTE: Cooking temperatures must be taken to make a determination of compliance or non-compliance. Do not rely upon discussions with managers or cooks to make a determination of compliance or non-compliance. If one food item is found out of temperature, that PHF category must be marked as Out of Compliance.)

IN OUT NA NO A. Raw shell eggs broken for immediate service cooked to 145 °F (63 °C) for 15 seconds. Raw shell eggs broken but not prepared for immediate service cooked to 155 °F (68 °C) for 15 seconds

IN OUT NA NO B. Comminuted Fish, Meats, Game animals cooked to 155 °F (68 °C) for 15 seconds

IN OUT NA NO C. Roasts, including formed roasts, are cooked to 130 °F (54 °C) for 112 minutes or as Chart specified and according to oven parameters per Chart **(NOTE: This data item includes beef roasts, corned beef roasts, pork roasts, and cured pork roasts such as ham).**

BASELINE DATA COLLECTION FORM (page 3 of 9)

- IN OUT NA NO** D. Poultry; stuffed fish, stuffed meat, stuffed pasta, stuffed poultry, stuffed ratites, or stuffing containing fish, meat, poultry or ratites cooked to 165 °F (74 °C) for 15 seconds
- IN OUT NA NO** E. Wild game animals cooked to 165 °F (74 °C) for 15 seconds
- IN OUT NA NO** F. Raw animal foods cooked in microwave are rotated, stirred, covered, and heated to 165 °F (74 °C). Food is allowed to stand covered for 2 minutes after cooking
- IN OUT NA NO** G. Pork, ratites, injected meats are cooked to 155 °F (68 °C) for 15 seconds. Specify product and temperature in the space below. **(NOTE: Pork observed cooked between 145 °F (63 °C) and 155 °F (68 °C), would be marked OUT here, but marked IN under Supplemental Item 17A. Please make notes in the comment section.)**
- IN OUT NA NO** H. All other PHF cooked to 145 °F (63 °C) for 15 seconds

STATUS 5. Rapid Reheating For Hot Holding

- IN OUT NA NO** A. PHF that is cooked and cooled on premises is rapidly reheated to 165 °F (74 °C) for 15 seconds for hot holding
- IN OUT NA NO** B. Food reheated in a microwave is heated to 165 °F (74 °C) or higher
- IN OUT NA NO** C. Commercially processed ready-to-eat food, reheated to 140 °F (60 °C) or above **for hot holding**
- IN OUT NA NO** D. Remaining unsliced portions of roasts are reheated for hot holding using minimum oven parameters

BASELINE DATA COLLECTION FORM (page 4 of 9)

****RISK FACTOR - IMPROPER HOLD****

LIMITATION OF GROWTH OF ORGANISMS OF PUBLIC HEALTH CONCERN

STATUS **6. Proper Cooling Procedure** *(NOTE: Record any temperature above 41 °F (5 °C) on blank lines. Production documents as well as statements from managers, person in charge (PIC), and employees, regarding the time the cooling process was initiated, may be used to supplement actual observations.)*

IN OUT NA NO A. Cooked PHF is cooled from 140 °F (60 °C) to 70 °F (21 °C) within 2 hours **and** from 140 °F (60 °C) to 41 °F (5 °C) or below within 6 hours

IN OUT NA NO B. PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F (5 °C) or below within 4 hours

IN OUT NA NO C. Foods received at a temperature according to Law are cooled to 41 °F (5 °C) within 4 hours

STATUS **7. Cold Hold (41 °F (5 °C))** *(NOTE: For the purposes of this Baseline, 41 °F (5 °C) or below will be used as the criteria for assessing all PHF that are maintained/held cold.) If one product is found out of temperature the item is marked Out of Compliance.)*

IN OUT A. PHF is maintained at 41 °F (5 °C) or below, except during preparation, cooking, cooling or when time is used as a public health control. *(Record products and temperatures in the space below.)*

BASELINE DATA COLLECTION FORM (page 5 of 9)

STATUS 8. Hot Hold (140 °F (60 °C))

IN OUT NA NO A. PHF is maintained at 140 °F (60 °C) or above, except during preparation, cooking, or cooling or when time is used as a public health control. **(NOTE: Products held between 135 °F (57 °C) and 140 °F (60 °C) should be marked OUT in 8A, but IN under supplemental item number 18A. Record actual product and measured temperatures in the space below.)**

IN OUT NA NO B. Roasts are held at a temperature of 130 °F (54 °C) or above

STATUS 9. Time

IN OUT NA NO A. Ready-to-eat PHF held for more than 24 hours is date marked as required (prepared on-site)

IN OUT NA NO B. Discard RTE PHF and/or opened commercial container exceeding 7 days at ≤ 41 °F (5 °C) or 4 days at ≤ 45 °F (7 °C)

IN OUT NA NO C. Opened Commercial container of prepared ready-to-eat PHF is date marked as required

IN OUT NA NO D. When time only is used as a public health control, food is cooked and served within 4 hours as required

****RISK FACTOR-CONTAMINATED EQUIPMENT****

PROTECTION FROM CONTAMINATION

STATUS 10. Separation / Segregation / Protection

IN OUT NA NO A. Food is protected from cross contamination by separating raw animal foods from raw ready-to-eat food and by separating raw animal foods from cooked ready-to-eat food

IN OUT NA NO B. Raw animal foods are separated from each other during storage, preparation, holding, and display

IN OUT C. Food is protected from environmental contamination – critical items

IN OUT NA NO D. After being served or sold to a consumer, food is not re-served

BASELINE DATA COLLECTION FORM (page 6 of 9)

STATUS **11. Food-Contact Surfaces** *(NOTE: This item will require some judgment to be used when marking this item IN or OUT of compliance. This item should be marked Out of Compliance if observations are made that supports a pattern of non-compliance with this item. One dirty utensil, food contact surface or one sanitizer container without sanitizer would not necessarily support an Out of Compliance mark. You must provide notes concerning an Out of Compliance mark on this item.)*

IN OUT A. Food-contact surfaces and utensils are clean to sight and touch and sanitized before use

****RISK FACTOR-POOR PERSONAL HYGIENE****

PERSONNEL

STATUS **12. Proper, Adequate Handwashing**

IN OUT A. Hands are clean and properly washed when and as required

STATUS **13. Good Hygienic Practices**

IN OUT NO A. Food Employees eat, drink, and use tobacco only in designated areas / do not use a utensil more than once to taste food that is sold or served / do not handle or care for animals present. Food employees experiencing persistent sneezing, coughing, or runny nose do not work with exposed food, clean equipment, utensils, linens, unwrapped single-service or single-use articles

BASELINE DATA COLLECTION FORM (page 7 of 9)

STATUS 14. Prevention of Contamination From Hands

IN OUT NA NO A. Employees do not contact exposed, ready-to-eat food with their bare hands. ***(NOTE: In determining the status of this data item, an assessment of alternative methods when otherwise approved is to be made to determine implementation in accordance with the guidelines contained in Annex 3, 2001 Food Code, page 289.)***

STATUS 15. Handwash Facilities

IN OUT A. Handwash facilities conveniently located and accessible for employees

IN OUT B. Handwash facilities supplied with hand cleanser / sanitary towels / hand drying devices

*****RISK FACTOR - OTHER*****

FOREIGN SUBSTANCES

STATUS 16. Chemicals

IN OUT NA A. If used, only approved food or color additives. Sulfites are not applied to fresh fruits and vegetables intended for raw consumption

IN OUT B. Poisonous or toxic materials, chemicals, lubricants, pesticides, medicines, first aid supplies, and other personal care items are properly identified, stored and used

IN OUT NA C. Poisonous or toxic materials held for retail sale are properly stored

BASELINE DATA COLLECTION FORM (page 8 of 9)

SUPPLEMENTAL ITEMS

(NOTE: The following items will be included as part of FDA's 2003 Baseline. These are additional items to the original 42 data item (contained in Section 1 – 16) that were assessed as part of the original baseline.)

STATUS 17. Proper Cooking Temperature (Supplement to Item 4G)

IN OUT NA NO A. Pork is cooked to 145 °F (63 °C) or above for 15 seconds.
(NOTE: Final cooking temperatures of Pork Roasts are recorded under data item 4C.)

IN OUT NA NO B. Ratites and injected meats are cooked to 155 °F (68 °C) for 15 seconds

STATUS 18. Hot Hold (135 °F (57 °C)) – (Supplement to Item 8A)

IN OUT NA NO A. PHF is maintained at 135 °F (57 °C) or above, except during preparation, cooking, or cooling or when time is used as a public health control. **(NOTE: Products held between 135 °F (57 °C) and 140 °F (60 °C) should be marked OUT in 8A. Record actual product and measured temperatures.)**

STATUS 19. Employee Health Policy

IN OUT A. Facility has a **written policy** that is consistent with 2-201 of the *Food Code* for excluding and restricting employees on the basis of their health and activities as they relate to diseases that are transmissible through food. **Written policy** includes a statement regarding employee responsibility to notify management of symptoms and illnesses identified in the *Food Code*.

BASELINE DATA COLLECTION FORM (page 9 of 9)

STATUS 20. Treating Juice

IN OUT NA NO A. When packaged in a food establishment, juice is treated under a HACCP Plan to reduce pathogens or be labeled as specified in the *Food Code*.

STATUS 21. Cooling – Raw Shell Eggs

IN OUT NA NO A. After receiving, raw shell eggs are immediately placed under refrigeration that maintains ambient air temperature of 45 °F (7 °C) or less.

STATUS 22. Cold Holding – Raw Shell Eggs

IN OUT NA NO A. After receipt, raw shell eggs are stored in refrigerated equipment that maintains ambient air temperature of 45 °F (7 °C) or less

STATUS 23. Food & food preparation for highly susceptible populations

(NOTE: These items pertain specifically to those facilities that serve Highly Susceptible Populations as defined in the Food Code. Establishments would include such facility types as Hospitals, Nursing Homes and Elementary Schools.)

IN OUT NA NO A. Prepackaged juice/beverage containing juice with a warning label (21 CFR, Section 101.17(g)) not served.

IN OUT NA NO B. Pasteurized eggs or egg products substituted for raw shell eggs in preparation of foods that are not cooked to minimum required temperatures, (specified in Section 4.0 of this Baseline Form), unless cooked to order & immediately served; broken immediately before baking and thoroughly cooked; or included as an ingredient for a recipe supported by a HACCP plan that controls Salmonella Enteritidis.

IN OUT NA NO C. Raw or partially cooked animal food and raw seed sprouts not served.

The following is the DATA COLLECTION FORM REFERENCE SHEET which shows the applicable *Food Code* sections under each individual data item:

H. Data Collection Procedure

Specialists conducted unannounced, non-regulatory inspections of the selected establishments. A representative from the state, county, or city agency having regulatory oversight over the establishments may have accompanied a Specialist. When conditions in the establishments merited regulatory actions, the accompanying state or local representative could intervene to ensure appropriate corrective actions were taken. If a state, county, or city representative was not accompanying a Specialist and conditions warranted regulatory action, the regulatory authority was contacted.

Quantitative measurements were made using various equipment such as calibrated thermocouples, heat-sensitive tape, and maximum registering stem thermometers. For certain data items (see data collection form), visual observations were supplemented by asking questions of food workers and/or managers.

Using the *1997 FDA Food Code* as a basis for the original forty-two individual data items and the *2001 FDA Food Code/2003 Food Code Supplement* for the Supplemental data items, the Specialists determined whether the observations made of the employee food safety practices or behaviors were IN Compliance, Out of Compliance, Not Observed, or Not Applicable. An observation is based on an evaluation of one or more occurrences of a data item at an establishment. If all observed occurrences are IN Compliance, the data item is marked "IN". If any observed occurrence is Out of Compliance, then the data item is marked "OUT".

- **IN** meaning that the observation was IN COMPLIANCE with applicable *FDA Food Code* provisions;
- **OUT** meaning that the observation was OUT OF COMPLIANCE with applicable *FDA Food Code* provisions. An explanation of the observation was provided in the comment sections on the data collection form;
- **N.O.** meaning the data item was NOT OBSERVED during the inspection. The N.O. notation was used when a data item was a usual practice in the food service operation, but the practice was not observed during the time of the inspection. For example, if a restaurant that seasonally serves shellfish was selected for the study but the inspection occurred during non-shellfish season, then the applicable data item was marked N.O.; or
- **N.A.** meaning the data item was NOT APPLICABLE. The N.A. notation was used when a data item was not part of the food service operation. For example, if a seafood department that conducts no cooking was selected for the study, then all data items pertaining to cooking were marked N.A.

The Specialists were provided specific instructions for using the four marking options for each of the data items. Not all four marking options were available for every individual data item. For instance, in the case of cold holding, all establishments that were

included in the data collection held PHF cold. As a result, the “not observed” (N.O.) and “not applicable” (N.A.) marking options were inappropriate given that an observation for cold holding was not only applicable in every case, but was also observable during every inspection.

The use of the “not observed” (N.O.) and “not applicable” (N.A.) as options for determining the status of individual data items was a critical component for attaining a meaningful performance indicator. For example, if the only options for marking compliance status were IN Compliance and Out of Compliance, then the default option for data items that did not apply to an operation would have been IN Compliance. If this were the case, the overall IN Compliance measurement for the establishment would have been higher than what was documented by actual observation of the food safety practice or employee behavior and would have been an over-estimate.

Likewise, for data items that did apply to an establishment’s operation, but were not observed during the inspection, the default marking option would have been IN Compliance. Again, the overall IN Compliance measurement for the establishment would have been higher than what was documented by actual observation of the food safety practice or employee behavior and would have been an over-estimate.

The Specialists were provided a copy of a software program customized to store and analyze the data collected. Specialists entered the data into a database and conducted a series of quality assurance checks to verify the accuracy of the information. The data from each Specialist’s software files was sent to FDA headquarters for entry into a central database. Before analyzing the data, an additional quality assurance review of the data was conducted to ensure reporting consistency within the established project design. FDA/CFSSAN/ Division of Mathematics performed the statistical analysis of the data.

I. Average Time Per Data Collection

Many regulatory agencies planning to conduct similar foodborne illness risk factor studies within their jurisdictions have requested information on data collection time for each of the facility types. During this data collection, FDA tracked the actual time spent in each of the inspected establishments. Table 6 presents the average data collection time, in minutes, for each of the facility types. Travel time and off-site report preparation were not included in the FDA time assessment.

Table 6

**Average Inspection Time per Establishment for each of the 9 Facility Types
(Total MINUTES per Establishment)**

Facility Type	Average Inspection Time (In Minutes)
HOSPITALS	155
ELEMENTARY SCHOOLS	99
NURSING HOMES	129
FAST FOOD RESTAURANTS	87
FULL SERVICE RESTAURANTS	133
DELI	94
MEAT & POULTRY	48
SEAFOOD	56
PRODUCE	41

III. RESULTS AND DISCUSSION

The results contained in this report are intended to focus attention on foodborne illness risk factors associated with food preparation procedures and employee behaviors in most need of improvement by industry. If food safety practices within institutional foodservice, restaurants, and retail food store facility types are to be significantly improved, individuals responsible for the management and oversight of food establishments must exercise active managerial control over the risk factors most often implicated as the cause of foodborne illness. Food safety management systems for control of these risk factors must be an integral part of daily operations.

Reducing the occurrence of foodborne illness risk factors should be a goal for all those involved in food safety. If this goal is to be achieved, regulatory retail food program managers need to establish program performance measures that are based on reducing the occurrence of these risk factors. Regulatory inspection programs should use intervention strategies that direct the foodservice and retail food industries' efforts toward attaining active managerial control of those food safety practices and employee behaviors most likely to contribute to foodborne illness. Recommended intervention strategies for both regulatory and industry food safety professionals are presented in Section IV – Recommendations.

Presentation of the data results

The results of the 2003 study are presented in three parts for each of the facility types.

- Part A. Presents the Percent of observations found Out of Compliance for each risk factor
- Part B. Presents the Percent of observations found Out of Compliance for individual data items that comprises a risk factor
- Part C. Summarizes the risk factors and individual data items needing priority attention

The results will be presented separately for each of the facility 9 types.

The figures presented in this section for each of the facility types include only observations from the original forty-two data items used in the 1998 baseline collection. These forty-two data items will be used to measure improvement and/or regression changes in the occurrence of foodborne illness risk factors for the duration of this study. None of the Supplemental data items (Sections 17-23 of the data collection form) are included as part of the data analysis in this section. The results and discussion of the supplemental data items will be addressed later in this report in Section VI, New Areas of Study – Supplemental Data Items.

Using the Data Collection Form (Pages 17 – 25) as a reference, the data items for each risk factor are sorted using the format presented in Table 7.

Table 7

Data Collection Form – Section Reference for Risk Factors

RISK FACTOR	Number of Data Items for each Risk Factor	Referenced Sections From Data Collection Form
Food from Unsafe Sources	7	Sections 1 – 3
Inadequate Cooking	12	Sections 4 – 5
Improper Holding/Time Temperature	10	Sections 6 – 9
Contaminated Equipment/Protection from Contamination	5	Sections 10 – 11
Poor Personal Hygiene	5	Sections 12 – 15
Other (Chemical Contamination)	3	Section 16
TOTAL NUMBER OF DATA ITEMS	42	

A. Percent of Observations found Out of Compliance for each RISK FACTOR

Table 8

Formula for Calculating RISK FACTOR Out of Compliance Percentages

Percent Out of Compliance =

$$\frac{\text{Total Number of Out of Compliance observations for a risk factor}}{\text{Total Number of OBSERVATIONS (IN and OUT) for the risk factor}} \times 100\%$$

The Percent Out of Compliance gives an indication of the overall effectiveness of existing food safety management systems for each of the risk factors for the 2003 data collection period. It can be inferred that the higher the Percent Out of Compliance, the weaker the management system for control of the risk factor.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

Table 9

Formula for Calculating Out of Compliance Percentages for each DATA ITEM that Comprises a Risk Factor

Percent Out of Compliance =
$\frac{\text{Total Out of Compliance Observations for a Data Item}}{\text{Total number of OBSERVATIONS (IN and OUT) for the Data Item}} \times 100\%$

The Percent Out of Compliance for an individual data item is the proportion of establishments where that data item was Out of Compliance when the practice or procedure could be observed. Each risk factor is comprised of several individual data items based on *1997 FDA Food Code* requirements. These individual data items can be used to assess in greater detail the degree of control a facility type had over each risk factor found to have a high Out of Compliance percentage. The greater the Percent Out of Compliance for an individual data item contained in a risk factor, the greater the need for improvement.

The figures in this section contain only those data items with the highest Out of Compliance percentages. In a few cases, there are one or more data items that warrant attention within a risk factor that had a relatively high overall IN Compliance percentage. For these data items, the results of the observations, rather than figures, are used to summarize the discussion points. The results for all data items are available in Appendices A – I.

C. Summary of foodborne illness RISK FACTORS and INDIVIDUAL DATA ITEMS in need of priority attention

Section C summarizes the foodborne illness risk factors and individual data items (i.e., food safety practices and behaviors) in need of priority attention suggested by the data presented in parts A and B. Those risk factors and data items with the most significant Out of Compliance percentages, based on the 2003 data collection are presented in the summary section.

INSTITUTIONAL FOODSERVICE

HOSPITALS

RESULTS AND DISCUSSION

Institutional Foodservice - HOSPITALS

A. Percent of observations found Out of Compliance for each RISK FACTOR

FOODBORNE ILLNESS RISK FACTOR	# OUT	Total Obs. (IN & OUT)	% OUT
Improper Holding/Time & Temperature	212	526	40.3%
Contaminated Equipment/Protection from Contamination	86	456	18.9%
Poor Personal Hygiene	84	480	17.5%
Other/Chemical	17	127	13.4%
Inadequate Cooking	16	255	6.3%
Food From Unsafe Sources	1	194	0.5%

Institutional Foodservice - HOSPITALS

Discussion for Figure H-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Contaminated equipment/protection from contamination and poor personal hygiene also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period. In general, the other/chemical risk factor had a high IN Compliance percentage.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For hospitals, the foodborne illness risk factors most in need of attention with their corresponding Out of Compliance percentages are:

- Improper Hold/Time and Temperature (40.3%)
- Contaminated Equipment/Protection from Contamination (18.9%)
- Poor Personal Hygiene (17.5%)

Figures H-2 thru H-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in hospitals to control each of the risk factors during the 2003 data collection.

In general, the other/chemical risk factor had a high IN Compliance percentage. There was, however, one data item within this risk factor that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

Institutional Foodservice – HOSPITALS

Institutional Foodservice - HOSPITALS

Figure H-2
IMPROPER HOLDING/TIME AND TEMPERATURE

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
PHF cooled to 70 °F in 2 hours/41 °F in total of 6 hours	23	39	59.0%
PHF held cold at 41 °F or below	56	97	57.7%
Commercially-processed, RTE, PHF date marked	41	85	48.2%
PHF held hot at 140 °F or above	36	95	37.9%
RTE, PHF date marked after 24 hours	33	93	35.5%
PHF(prepared from ingredients at ambient temperature) cooled to 41 °F or below within 4 hours	9	29	31.0%
RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F	12	67	17.9%
* Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.*	2*	14*	*
* Roasts are held at a temperature of 130 °F or above*	0*	5*	*
* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	2*	*

* These three remaining Improper Holding/Time & Temperature Data Items do not appear in Figure H-2 due to a low number of total observations (obs.)

Institutional Foodservice - HOSPITALS

Discussion for Figure H-2

The data items, with their corresponding Out of Compliance percentages, for the improper holding/time and temperature risk factor that are most in need of attention include:

- Cooling of potentially hazardous food (PHF) (59.0%)
- Maintaining cold holding temperatures for PHF (57.7%)
- Date marking of open containers of commercially-processed ready-to-eat PHF (48.2%) and ready-to eat PHF made on-site (35.5%)
- Maintaining hot holding temperatures for PHF (37.9%)

Cooling of PHF

Safe cooling requires the removal of heat from foods quickly enough to prevent the growth of spore-forming pathogens. Hospital foodservice directors and managers need to ensure their practices and procedures are capable of rapidly cooling PHF.

The total number of observations for cooling was substantially less than the total number of observations for other data items. The time of day the data was collected and the length of the time available to spend in a facility were significant factors limiting the number of observations of cooling. For example, as much as six hours may be required on site to document compliance with the *FDA Food Code* critical limits for cooling. Nonetheless, observations made of cooked or reheated PHF during cooling had the highest Out of Compliance percentage. In addition, the Percent Out of Compliance for cooling PHFs from ambient temperature ingredients is also of interest and procedures for this process should be evaluated to ensure that food safety controls are in place.

Cold and Hot Holding of PHF

Holding PHF at the proper cold or hot temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Date Marking

Date marking of refrigerated ready-to-eat, PHF foods is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that has remained in cold storage beyond the parameters described in the *FDA Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served. The importance of date marking of ready-to-eat, PHF is accentuated in the hospital environment because the meals are primarily served to a highly susceptible population.

Institutional Foodservice - HOSPITALS

Institutional Foodservice - HOSPITALS

Figure H-3
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION

PERCENT (%) of OBSERVATIONS found
 Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Surfaces/Utensils cleaned/sanitized	37	97	38.1%
Raw/RTE foods, separated	22	97	22.7%
Raw animal food, separated	14	96	14.6%
Protected from environmental contamination	12	97	12.4%
After being served, food is not re-served	1	69	1.4%

Institutional Foodservice - HOSPITALS

Discussion for Figure H-3

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (38.1%)
- Separating raw animal foods from ready-to-eat foods (22.7%)
- Separating raw animal foods from each other (14.6%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in hospital foodservice management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Institutional Foodservice - HOSPITALS

Institutional Foodservice - HOSPITALS

Figure H-4
POOR PERSONAL HYGIENE

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Proper, adequate handwashing	32	95	33.7%
Good hygienic practices	17	96	17.7%
Handwashing facility, convenient/accessible	15	97	15.5%
Handwashing facility, cleanser/drying device	11	97	11.3%
Prevention of hand contamination	9	95	9.5%

Institutional Foodservice - HOSPITALS

Discussion for Figure H-4

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (33.7%)
- Good hygienic practices (17.7%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to the lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

While handwashing continues to be a primary concern, the results from the 2003 study show a relatively high IN Compliance percentage (90.5%) for preventing direct hand contamination of food in hospitals. Hospital foodservice managers appear to be making a concerted effort to eliminate bare hand contact with ready-to-eat foods.

Good Hygienic Practices

Proper hygienic practices by food employees minimize the possibility of transmitting disease through food. Employee practices such as eating, drinking and smoking in food preparation areas and working while experiencing persistent coughing and sneezing must be prohibited. Elimination of these practices will help prevent the transfer of microorganisms to foods and food contact surfaces.

Discussion for the Other/Chemical Risk Factor

Table 10

Assessment of the Other/Chemical Category – HOSPITALS

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
17	97	17.5%

Institutional Foodservice - HOSPITALS

All of the Out of Compliance observations relating to the other/chemical risk factor are attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in hospitals are in need of attention. Food safety procedures related to the identification, storage, and use of cleaners, sanitizers, and other chemicals need to be reviewed and revised, if necessary, to address any gaps in the program that may be contributing to the Out of Compliance observations made of this data item.

C. Summary of Foodborne Illness RISK FACTORS and INDIVIDUAL DATA ITEMS in need of priority attention.

Table 11

Institutional Foodservice – HOSPITALS

Summary of Foodborne Illness RISK FACTORS and DATA ITEMS in Need of Priority Attention

FOODBORNE ILLNESS RISK FACTOR in need of Priority Attention (From Section A)	INDIVIDUAL DATA ITEM in need of Priority Attention (From Section B)
Improper Holding/ Time & Temperature	PHF cooled to 70 °F in 2 hours/41 °F in total of 6 hours
	PHF held cold at 41 °F or below
	Commercially-processed RTE, PHF date marked
	PHF held hot at 140 °F or above
	RTE PHF date marked after 24 hours
	PHF (prepared from ingredients at ambient temperature) cooled to 41 °F or below within 4 hours
	RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F
Contaminated Equipment/ Protection from Contamination	Surface/Utensils cleaned/sanitized
	Raw animal foods separated from RTE foods
	Raw animal foods separated from each other
Poor Personal Hygiene	Proper, adequate handwashing
	Good hygienic practices
Other/Chemical	Poisonous or toxic materials are properly identified, stored, and used

Inadequate Cooking	8	161	5.0%
Food From Unsafe Sources	6	190	3.2%

Institutional Foodservice – NURSING HOMES

Discussion For Figure NH-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Contaminated equipment/protection from contamination, poor personal hygiene, and chemical contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For nursing homes, the foodborne illness risk factors in most need of attention with their corresponding Out of Compliance percentages are:

- Improper Holding/Time and Temperature (30.7%)
- Contaminated Equipment/Protection from Contamination (20.4%)
- Poor Personal Hygiene (20.2%)
- Other/Chemical (18.1%)

Figures NH-2 thru NH-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in nursing homes to control each of the risk factors during the 2003 data collection.

In general, the other/chemical risk factor had a high IN Compliance percentage. There was, however, one data item within this risk factor that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

Institutional Foodservice – NURSING HOMES

* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	2*	*

* These three remaining Improper Holding/Time & Temperature Data Items do not appear in Figure NH-2 due to a low number of total observations (obs.)

Institutional Foodservice – NURSING HOMES

Discussion for Figure NH-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Cooling of potentially hazardous food (PHF) (65.4%)
- Date marking of open containers of commercially-processed ready-to-eat PHF (42.7%) and ready-to-eat PHF made on site (29.9%)
- Maintaining cold holding temperatures for PHF (36.2%)
- Maintaining hot holding temperatures for PHF (24.3%)

Cooling of PHF

Safe cooling requires the removal of heat from foods quickly enough to prevent the growth of spore-forming pathogens. Nursing home foodservice directors and managers need to ensure their practices and procedures are capable of rapidly cooling PHF.

The total number of observations for cooling was substantially less than the total number of observations for other data items. The time of day the data was collected and the length of the time available to spend in a facility were significant factors limiting the number of observations of cooling. For example, as much as six hours may be required on site to document compliance with the *FDA Food Code* critical limits for cooling.

Date Marking

Date marking of refrigerated ready-to-eat, PHF is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that has remained in cold storage beyond the parameters described in the *FDA Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served. The importance of date marking of ready-to-eat, PHF is accentuated in the nursing home environment because the meals are primarily served to a highly susceptible population.

Cold and Hot Holding of PHF

Holding PHF at the proper cold or hot temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Raw animal food, separated	14	88	15.9%
Protected from environmental contamination	13	94	13.8%
After being served, food is not re-served	1	57	1.8%

Institutional Foodservice – NURSING HOMES

Discussion for Figure NH-3

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (37.2%)
- Separating raw animal foods from ready-to-eat foods (26.1%)
- Separating raw animal foods (15.9%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in nursing home foodservice management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Proper, adequate handwashing	34	85	40.0%
Prevention of hand contamination	18	89	20.2%
Handwashing facility, convenient/accessible	16	94	17.0%
Handwashing facility, cleanser/drying device	12	94	12.8%
Good hygienic practices	11	88	12.5%

Institutional Foodservice – NURSING HOMES

Discussion for Figure NH-4

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (40.0%)
- Prevention of hand contamination (20.2%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to a lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

Prevention of Hand Contamination

Handwashing alone may not prevent the transmission of pathogens to foods via hand contact, therefore, preventing bare hand contact with ready-to-eat foods is a major control measure for limiting the spread of harmful bacteria and viruses from the hands to ready-to-eat food. Reinforcing the importance of preventing bare hand contact with ready-to-eat foods should be supported by a management system that includes proper employee training and monitoring of practices to identify to what extent procedures are being followed.

Discussion of the Other/Chemical Risk Factor

Table 12

Assessment of the Other/Chemical Category – NURSING HOMES

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
21	94	22.3%

Institutional Foodservice – NURSING HOMES

All of the Out of Compliance observations relating to the other/chemical risk factor are attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in nursing homes is in need of attention. Food safety procedures related to the identification, storage and use of cleaners, sanitizers, and other chemicals need to be reviewed and revised, if necessary, to address any gaps in the program that may be contributing to the Out of Compliance observations of this data item.

C. Summary of foodborne illness RISK FACTORS and INDIVIDUAL DATA ITEMS in need of priority attention

Table 13

Institutional Foodservice – NURSING HOMES

Summary of Foodborne Illness RISK FACTORS and DATA ITEMS in Need of Priority Attention

FOODBORNE ILLNESS RISK FACTOR in need of Priority Attention (From Section A)	INDIVIDUAL DATA ITEMS in need of priority attention (From Section B)
Improper Holding/ Time & Temperature	PHF cooled to 70 °F in 2 hours/41 °F in total of 6 hours
	Commercially-processed RTE, PHF date marked
	PHF held cold at 41 °F or below
	RTE PHF date marked after 24 hours
	PHF held hot at 140 °F or above
Contaminated Equipment/ Protection from Contamination	Surface/Utensils cleaned/sanitized
	Raw animal foods separated from RTE foods
	Raw animal foods separated from each other
Poor Personal Hygiene	Proper, adequate handwashing
	Prevention of hand contamination
Other/Chemical	Poisonous or toxic materials properly identified, stored, and used

ELEMENTARY SCHOOLS

RESULTS AND DISCUSSION

Institutional Foodservice – ELEMENTARY SCHOOLS

A. Percent of observations found Out of Compliance for each RISK FACTOR

FOODBORNE ILLNESS RISK FACTOR	# OUT	Total Obs. (IN & OUT)	% OUT
Improper Holding/Time & Temperature	118	383	30.8%
Other/Chemical	24	113	21.2%
Poor Personal Hygiene	78	478	16.3%
Contaminated Equipment/Protection from Contamination	46	340	13.5%
Food from Unsafe Sources	9	199	4.5%
Inadequate Cooking	3	99	3.0%

Institutional Foodservice – ELEMENTARY SCHOOLS

Discussion for Figure ES-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Chemical contamination, poor personal hygiene, and contaminated equipment/protection from contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For elementary schools, the foodborne illness risk factors most in need of attention and their corresponding Out of Compliance percentages are:

- Improper Holding/Time and Temperature (30.8%)
- Other/Chemical (21.2%)
- Poor Personal Hygiene (16.3%)
- Contaminated Equipment/Protection from Contamination (13.5%)

Figures ES-2 thru ES-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in elementary schools to control each of the risk factors during the 2003 data collection.

The Out of Compliance percentage noted for the other/chemical risk factor was attributed to one specific data item that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

Institutional Foodservice – ELEMENTARY SCHOOLS

Institutional Foodservice - ELEMENTARY SCHOOLS

Figure ES-2
IMPROPER HOLDING/TIME AND TEMPERATURE

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each Data Item

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Commercially-processed, RTE, PHF date marked	32	64	50.0%
RTE, PHF date marked after 24 hours	22	51	43.1%
PHF held cold at 41 °F or below	28	98	28.6%
PHF held hot at 140 °F or above	21	82	25.6%
RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F	8	43	18.6%
Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.	1	26	3.8%
* PHF cooled to 70 °F in 2 hours/41 °F in total of 6 hours *	5*	8*	*
* PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F or below within 4 hours*	1*	7*	*
* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	4*	*
* Roasts are held at a temperature of 130 °F or above*	0*	0*	*

* These four remaining Improper Holding/Time & Temperature Data Items do not appear in Figure ES-2 due to a low number of total observations (obs.)

Institutional Foodservice – ELEMENTARY SCHOOLS

Discussion for Figure ES-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Date marking of open containers of commercially-processed, ready-to-eat PHF (50.0%) and ready-to eat, PHF made on site (43.1%)
- Maintaining cold holding temperatures for PHF (28.6%)
- Maintaining hot holding temperatures for PHF (25.6%)

Date Marking

Date marking of refrigerated ready-to-eat, PHF is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that has remained in cold storage beyond the parameters described in the *Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served. The importance of date marking of ready-to-eat, PHF is accentuated in elementary schools because the meals are primarily served to a highly susceptible population.

Cold and Hot Holding of PHF

Holding PHF at the proper hot or cold temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Discussion for the Other/Chemical Risk Factor

Table 14

Assessment of the Other/Chemical Category – ELEMENTARY SCHOOLS

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
24	98	24.5%

All of the Out of Compliance observations relating to the other/chemical risk factor were attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in elementary schools is in need of attention. Food safety procedures related to the identification, storage, and use of cleaners, sanitizers, and other chemicals need to be reviewed and revised, if necessary, to address any gaps in the program that may be contributing to the high Out of Compliance percentage.

Prevention of hand contamination	15	92	16.3%
Good hygienic practices	13	96	13.5%
Handwashing facility, convenient/accessible	13	98	13.3%
Handwashing facility, cleanser/drying device	7	98	7.1%

Institutional Foodservice – ELEMENTARY SCHOOLS

Discussion for Figure ES-3

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (31.9%)
- Prevention of hand contamination (16.3%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to a lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

Prevention of Hand Contamination

Handwashing alone may not prevent the transmission of pathogens to foods via hand contact, therefore, preventing bare hand contact with ready-to-eat foods is a major control measure for limiting the spread of harmful bacteria and viruses from the hands to ready-to-eat food. Reinforcing the importance of preventing bare hand contact with ready-to-eat foods should be supported by a management system that includes proper employee training and monitoring of practices to identify to what extent procedures are being followed.

Institutional Foodservice – ELEMENTARY SCHOOLS

Figure ES-4
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Surfaces/Utensils cleaned/sanitized	25	98	25.5%
Raw/RTE foods, separated	7	48	14.6%
Protected from environmental contamination	11	98	11.2%
After being served, food is not e-served	2	61	3.3%
Raw animal foods, separated	1	35	2.9%

Institutional Foodservice – ELEMENTARY SCHOOLS

Discussion for Figure ES-4

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (25.5%)
- Separating raw animal foods from ready-to-eat foods (14.6%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in elementary school foodservice management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Restaurants – FAST FOOD

Discussion for Figure FF-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Poor personal hygiene, chemical contamination, and contaminated equipment/protection from contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For fast food restaurants, the foodborne illness risk factors most in need of attention and their corresponding Out of Compliance percentages are:

- Improper Holding/Time and Temperature (41.7%)
- Poor Personal Hygiene (31.2%)
- Other/Chemical (28.3%)
- Contaminated Equipment/Protection from Contamination (21.9%)

Figures FF-2 thru FF-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in fast food restaurants to control each of the risk factors during the 2003 data collection.

The Out of Compliance percentage noted for the other/chemical risk factor was attributed to one specific data item that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

In addition, the inadequate cooking risk factor had one data item of interest. The results for cooking comminuted fish/meat/game animals will also be presented.

Restaurants – FAST FOOD

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Commercially-processed, RTE, PHF date marked	38	66	57.6%
PHF held cold at 41 °F or below	61	108	56.5%

Prevention of hand contamination	53	105	50.5%
Good hygienic practices	23	104	22.1%
Handwashing facility, cleanser/drying device	17	108	15.7%
Handwashing facility, convenient/accessible	16	108	14.8%

Restaurants – FAST FOOD

Discussion for Figure FF-3

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (53.8%)
- Prevention of hand contamination (50.5%)
- Good hygienic practices (22.1%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to a lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

Prevention of Hand Contamination

Handwashing alone may not prevent the transmission of pathogens to foods via hand contact, therefore, preventing bare hand contact with ready-to-eat foods is a major control measure for limiting the spread of harmful bacteria and viruses from the hands to ready-to-eat food. Reinforcing the importance of preventing bare hand contact with ready-to-eat foods should be supported by a management system that includes proper employee training and monitoring of practices to identify to what extent procedures are being followed.

Good Hygienic Practices

Proper hygienic practices by food employees minimize the possibility of transmitting disease through food. Employee practices such as eating, drinking, and smoking in food preparation areas and working while experiencing persistent coughing and sneezing must be prohibited. Elimination of these practices will help prevent the transfer of microorganisms to foods and food contact surfaces.

Restaurants – FAST FOOD

Restaurants - FAST FOOD

Figure FF-4
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION

PERCENT (%) of OBSERVATIONS found
 Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT

Raw/RTE foods, separated	17	91	18.7%
Protected from environmental contamination	17	108	15.7%
Raw animal foods, separated	6	81	7.4%
After being served, food is not re-served	0	46	0.0%

Restaurants – FAST FOOD

Discussion for Figure FF-4

The food safety procedures for contaminated equipment/protection from contamination risk factor that are in most need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (50.9%)
- Separating raw animal foods from ready-to-eat foods (18.7%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in fast food restaurant management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Restaurants – FAST FOOD

Discussion for the Other/Chemical Risk Factor

Table 15

Assessment of the Other/Chemical Category – FAST FOOD RESTAURANTS

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
34	108	31.5%

All of the Out of Compliance observations relating to the other/chemical risk factor are attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in fast food restaurants are in need of attention. Food safety procedures related to the identification, storage, and use of cleaners, sanitizers, and other chemicals need to be reviewed and revised, if necessary, to address any gaps in the program that may be contributing to the Out of Compliance observations for this data item.

Discussion for the Inadequate Cooking Risk Factor

Table 16

Assessment of the Inadequate Cooking Risk Factor FAST FOOD RESTAURANTS

Comminuted Fish/Meats/Game Animals Cooked to 155 °F/15 seconds

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
8	50	16.0%

Cooking foods to temperatures that destroy pathogens is critical to reducing the risk of foodborne illness. The minimum internal product temperature and the time that this temperature must be maintained are dictated by the type of food product being cooked. Proper monitoring and control of cooking operations is central to an effective food safety management system in any establishment.

Of the fast food restaurants observed to be cooking comminuted (ground) meat/fish/game animals, 16% of these were found to be Out of Compliance. The large number of servings of these foods, prepared and sold by fast food restaurants, suggest that reducing the Out of Compliance percentage for this data item is an important public health concern.

Discussion for Figure FS-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Poor personal hygiene, contaminated equipment/protection from contamination, and chemical contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For full service restaurants, the foodborne illness risk factors most in need of attention and their Out of Compliance percentages are:

- Improper Holding/Time Temperature (63.8%)
- Poor Personal Hygiene (41.7%)
- Contaminated Equipment/Protection from Contamination (37.3%)
- Other/Chemical (30.6%)

Figures FS-2 thru FS-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in full service restaurants to control each of the risk factors during the 2003 data collection.

The other/chemical, inadequate cooling, and food from unsafe sources risk factors all had high IN Compliance percentages. There were, however, a few data items within each of these risk factors that are in need of attention. Information for these data items will be presented as part of the discussion.

Restaurants – FULL SERVICE

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
PHF held cold at 41 °F or below	77	99	77.8%
PHF cooled to 70 °F in 2 hours/41 °F in total of 6 hours	34	44	77.3%
RTE, PHF date marked after 24 hours	69	93	74.2%
Commercially-processed, RTE, PHF date marked	43	67	64.2%
PHF held hot at 140 °F or above	42	87	48.3%
RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F	16	36	44.4%
* Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.*	6*	18*	*
* PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F or below within 4 hours*	7*	16*	*
* Roasts are held at a temperature of 130 °F or above*	3*	5*	*
* When time only is used as a public health control, food is cooked and served within 4 hours*	3*	5*	*

* These four remaining Improper Holding/Time & Temperature Data Items do not appear in Figure FS-2 due to a low number of total observations (obs.)

Restaurants – FULL SERVICE

Discussion for Figure FS-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Maintaining cold holding temperatures for PHF (77.8%)
- Cooling of PHF (77.3%)
- Date marking of ready-to eat, PHF made on-site (74.2%) and open containers of commercially-processed, ready-to-eat PHF (64.2%)
- Maintaining hot holding temperatures for PHF (48.3.9%)
- Discarding RTE, PHF after they have exceeded time/temperature storage limits (44.4%)

Cold and Hot Holding of PHF

Holding PHF at the proper cold or hot temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Cooling of PHF

Safe cooling requires the removal of heat from foods quickly enough to prevent the growth of spore-forming pathogens. Foodservice directors and managers within full service restaurants need to ensure their practices and procedures are capable of rapidly cooling PHF.

The total number of observations for cooling was substantially less than the total number of observations for other data items. The time of day the data was collected and the length of the time available to spend in a facility were significant factors limiting the number of observations of cooling. For example, as much as six hours may be required on site to document compliance with the *Food Code* critical limits for cooling.

Date Marking

Date marking of refrigerated ready-to-eat, PHF, such as deli meats, meat or seafood salads, and soft cheeses, is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF foods that has remained in cold storage beyond the parameters described in the *Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served.

Proper, adequate handwashing	72	99	72.7%
Prevention of hand contamination	53	93	57.0%
Good hygienic practices	33	97	34.0%
Handwashing facility, convenient/accessible	23	99	23.2%
Handwashing facility, cleanser/drying device	22	99	22.2%

Restaurants – FULL SERVICE

Discussion for Figure FS-3

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (72.7%)
- Prevention of hand contamination (57.0%)
- Good hygienic practices (34.0%)
- Handwashing facility, convenient/accessible (23.2%)
- Handwashing facility, cleanser/drying device (22.2%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities or supplies of hand cleanser/drying devices may contribute to a lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

Prevention of Hand Contamination

Handwashing alone may not prevent the transmission of pathogens to foods via hand contact, therefore, preventing bare hand contact with ready-to-eat foods is a major control measure for limiting the spread of harmful bacteria and viruses from the hands to ready-to-eat food. Reinforcing the importance of preventing bare hand contact with ready-to-eat foods should be supported by a management system that includes proper employee training and monitoring of practices to identify to what extent procedures are being followed.

Good Hygienic Practices

Proper hygienic practices by food employees minimize the possibility of transmitting disease through food. Employee practices such as eating, drinking and smoking in food preparation areas and working while experiencing persistent coughing and sneezing must be prohibited. Elimination of these practices will help prevent the transfer of microorganisms to foods and food contact surfaces.

Figure FS-4
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Surfaces/Utensils cleaned/sanitized	56	99	56.6%
Raw/RTE foods, separated	45	96	46.9%
Protected from environmental contamination	35	99	35.4%
Raw animal foods, separated	24	94	25.5%
After being served, food is not re-served	3	49	6.1%

Restaurants – FULL SERVICE

Discussion for FS-4

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (56.6%)
- Separating raw animal foods from ready-to-eat foods (46.9%)
- Protection from environmental contamination (35.4%)
- Separating raw animal foods (25.5%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in full service restaurant management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Protection from Environmental Contamination

Food that is inadequately packaged or contained in damaged packaging could become contaminated by microbes, dust, condensate waste, or chemicals. These contaminants may be introduced by other products or equipment stored in close proximity or by persons who are delivering, stocking or opening packages. Foodservice managers need to ensure that standard operating procedures are in place to protect food from environmental contamination from the moment it is received until served or sold to the

Restaurants – FULL SERVICE

consumer. Except during cooling, stored products should be covered or wrapped to prevent the entry of microbes and other contaminants.

Discussion for the Other/Chemical Risk Factor

Table 18

Assessment of the Other/Chemical Category FULL SERVICE RESTAURANTS

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
38	99	38.4%

All of the Out of Compliance observations relating to the other/chemical risk factor were attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in full service restaurants are in need of attention. Food safety procedures related to the identification, storage, and use of cleaners, sanitizers, and other chemicals need to be reviewed and revised, if necessary, to address any gaps in the program that may be contributing to the Out of Compliance observations made of this data item.

Discussion for the Inadequate Cooking Risk Factor

Cooking foods to temperatures that destroy pathogens is critical to reducing the risk of foodborne illness. The minimum internal product temperature and the time that this temperature must be maintained are dictated by the type of food product being cooked. Proper monitoring and control of cooking operations is central to an effective food safety management system in any establishment.

Restaurants – FULL SERVICE

Cooking of poultry and stuffed food products

Table 19

Assessment of the Inadequate Cooking Risk Factor FULL SERVICE RESTAURANTS

Poultry, Stuffed Fish, Meat, Pasta Cooked to 165 °F (74 °C) for 15 sec.

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
9	47	19.2%

Cooking poultry and stuffed food products (fish, meat, pasta, poultry, and ratites) to an internal temperature of 165 °F (74 °C) for 15 seconds ensures the destruction of bacteria such as *Salmonellae* and *Escherichia coli O157:H7* that may be present in the raw product. Of the full service restaurants observed to be cooking these products, approximately 19% were found to be Out of Compliance with this important food safety requirement.

Reheating of PHF

Table 20

Assessment of the Inadequate Cooking Risk Factor FULL SERVICE RESTAURANTS

PHF Rapidly Reheated to 165 °F (74 °C) for 15 sec. for Hot Holding

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
11	36	30.6%

It is important to properly reheat PHF that was initially cooked and cooled on premises and which is to be held hot prior to serving. Reheating these products to 165 °F (74 °C) for 15 seconds ensures that pathogens that may have contaminated the food after cooking are destroyed and are not given the opportunity to multiply during hot holding. Of the full service restaurants in which reheating of PHF for hot holding was observed, approximately 31% were found to be Out of Compliance.

Restaurants – FULL SERVICE

Discussion for the Food from Unsafe Sources Risk Factor

Table 21

Assessment of the Food from Unsafe Sources Risk Factor FULL SERVICE RESTAURANTS

Shellstock Tags Retained for 90 Days

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
13	19	68.4%

The overall IN Compliance percentage for data items that comprise the food from unsafe sources risk factor is high indicating effective management of this area. There is one exception to this general observation – retention of shellstock tags for 90 days.

It is important to note that this data item had only nineteen total observations. Of the observations made, thirteen were Out of Compliance. Data items with less than twenty total observations have generally not been singled out for discussion in this report. An exception is made here because only a minority of full service restaurants offered shellstock as a menu item. Therefore, one would not expect a large number of observations to be made of this item in full service restaurants.

Shellfish harvested from contaminated water can harbor harmful bacteria and viruses. Effective monitoring of shellfish sources must be continuous and involve all segments of the industry. Retention of shellstock tags for 90 days is not a direct contributing factor to the occurrence of foodborne illness. It is, however, an essential management practice that provides a means for conducting tracebacks to the harvest areas should a food-related illness or contamination be associated with shellstock.

DELI DEPARTMENTS/STORES

RESULTS AND DISCUSSION

Retail Food - DELIS

A. Percent of observations found Out of Compliance for each RISK FACTOR

FOODBORNE ILLNESS RISK FACTOR	# OUT	Total Obs. (IN & OUT)	% OUT
Improper Holding/Time & Temperature	315	489	64.4%
Poor Personal Hygiene	124	528	23.5%
Contaminated Equipment/Protection from Contamination	102	435	23.4%
Other/Chemical	30	137	21.9%
Inadequate Cooking	14	153	9.2%
Food From Unsafe Sources	11	221	5.0%

Retail Food - DELIS

Discussion for Figure D-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Poor personal hygiene, contaminated equipment/protection from contamination and chemical contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

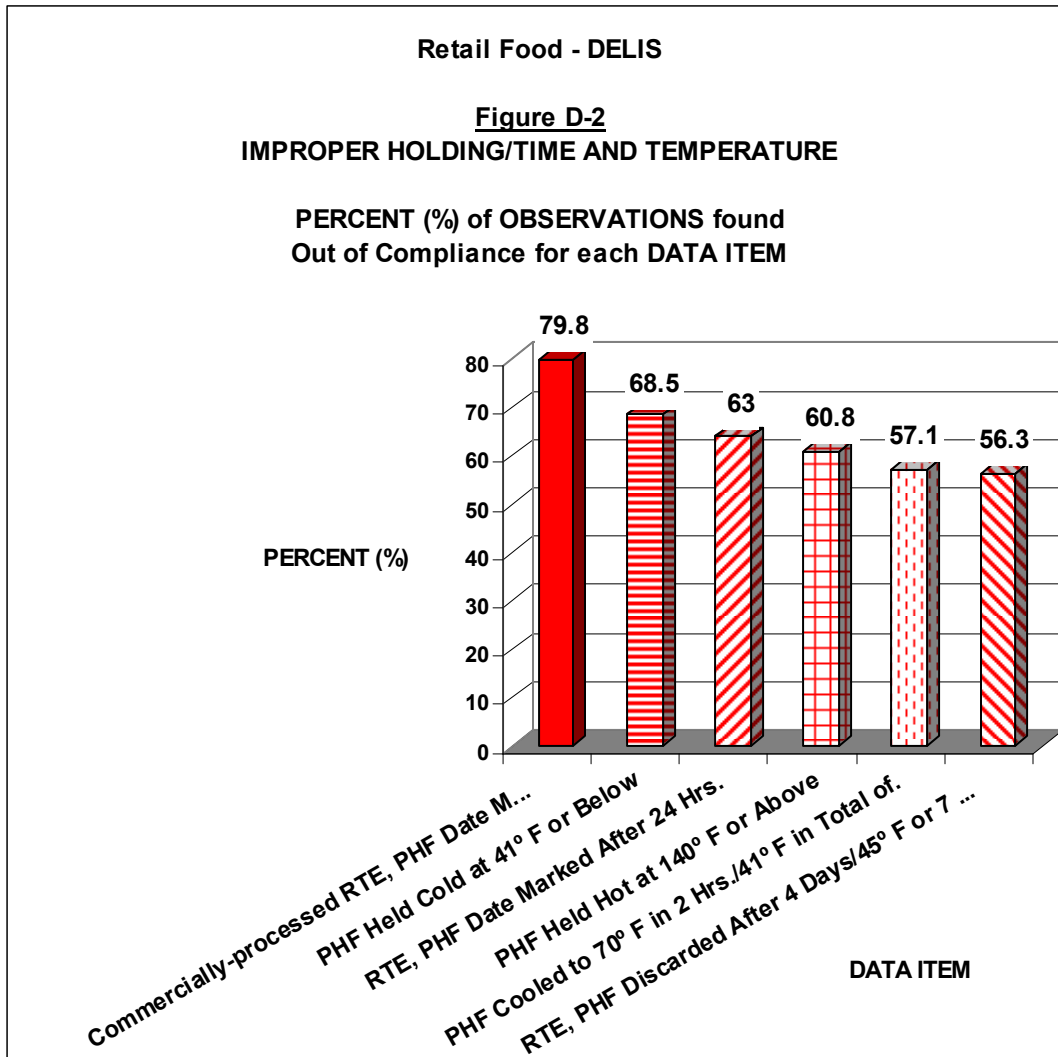

For delis, the foodborne illness risk factors most in need of attention with their corresponding Out of Compliance percentages are:

- Improper Holding/Time and Temperature (64.4%)
- Poor Personal Hygiene (23.5%)
- Contaminated Equipment/Protection from Contamination (23.4%)
- Other/Chemical (21.9%)

Figures D-2 thru D-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in delis to control each of the risk factors during the 2003 data collection.

In general, the other/chemical risk factor had a high IN Compliance percentage. There was, however, one data item within this risk factor that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

Retail Food - DELIS

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Commercially-processed, RTE, PHF date marked	79	99	79.8%
PHF held cold at 41 °F or below	74	108	68.5%
RTE, PHF date marked after 24 hours	51	81	63.0%
PHF held hot at 140 °F or above	59	97	60.8%
PHF cooled to 70 °F on 2 hours/41 °F in total of 6 hours	16	28	57.1%
RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F	27	48	56.3%
* PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F or below within 4 hours *	6*	13*	*
* Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.*	1*	9*	*
* Roasts are held at a temperature of 130 °F or above*	2*	4*	*
* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	2*	*

* These four remaining Improper Holding/Time & Temperature Data Items do not appear in Figure D-2 due to a low number of total observations (obs.)

Retail Food - DELIS

Discussion for Figure D-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Date marking of open containers of commercially-processed, ready-to-eat, PHF (79.8%) and ready-to eat, PHF made on site (63.0%)
- Maintaining cold holding temperatures for PHF (68.5%)
- Maintaining hot holding temperatures for PHF (60.8%)
- Cooling of PHF (57.1%)

Date Marking

Date marking of refrigerated ready-to-eat, PHF, such as deli meats, meat salads, and soft cheeses, is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that has remained in cold storage beyond the parameters described in the *Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served.

Cold and Hot Holding of PHF

Holding PHF at the proper cold and hot temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Cooling of PHF

Safe cooling requires the removal of heat from foods quickly enough to prevent the growth of spore-forming pathogens. Deli foodservice directors and managers need to ensure their practices and procedures are capable of rapidly cooling PHF.

The total number of observations for cooling was substantially less than the total number of observations for other data items. The time of day the data was collected and the length of the time available to spend in a facility were significant factors limiting the number of observations of cooling. For example, as much as six hours may be required on site to document compliance with the *Food Code* critical limits for cooling.

Retail Food - DELIS

**Figure D-3
POOR PERSONAL HYGIENE**

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Proper, adequate handwashing	58	102	56.9%
Handwashing facility, convenient/accessible	24	108	22.2%
Handwashing facility, cleanser/drying device	21	108	19.4%
Good hygienic practices	11	106	10.4%
Prevention of hand contamination	10	104	9.6%

Retail Food - DELIS

Discussion for Figure D-3

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (56.9%)
- Handwashing facility, convenient/accessible (22.2%)
- Handwashing facility, cleanser/drying device (19.4%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to the lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

While handwashing continues to be a primary concern, the results from the 2003 study show a relatively high IN Compliance percentage (90.4%) for preventing direct hand contamination with food in delis. The retail food management in delis appear to be making a concerted effort to eliminate bare hand contact with ready-to-eat foods.

Retail Food - DELIS

Retail Food - DELIS

**Figure D-4
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION**

**PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM**

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Surfaces/Utensils cleaned/sanitized	63	108	58.3%
Raw/RTE foods separated	21	105	20.0%
Protected from environmental contamination	14	108	13.0%
Raw animal foods, separated	4	82	4.9%
After being served, food is not re-served	0	32	0.0%

Retail Food - DELIS

Discussion for Figure D-4

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (58.3%)
- Separating raw animal foods from ready-to-eat foods (20.0%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in deli food safety management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Protected from environmental contamination	9	109	8.3%
After being served, food is not re-served	0	26	0.0%

Retail Food – MEAT & POULTRY

Discussion for Figure MP-3

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (42.2%)
- Separating raw animal foods from ready-to-eat foods (29.9%)
- Separating raw animal foods from each other (24.3%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in meat and poultry department management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

RESULTS AND DISCUSSION

Retail Food – SEAFOOD

A. Percent of observations found Out of Compliance for each RISK FACTOR

FOODBORNE ILLNESS RISK FACTOR	# OUT	Total Obs. (IN & OUT)	% OUT
Improper Holding/Time & Temperature	95	225	42.2%
Contaminated Equipment/Protection from Contamination	84	419	20.0%
Other/Chemical	21	120	17.5%
Poor Personal Hygiene	74	441	16.8%
Food from Unsafe Sources	47	370	12.7%
* Inadequate Cooking*	2*	7*	*

* Data for the Inadequate Cook Risk Factor is not reflected in the Figure S-1 due to a low number of observations (obs.)

Retail Food – SEAFOOD

Discussion for Figure S-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Contaminated equipment/protection from contamination, chemical contamination, and poor personal hygiene also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

For seafood departments, the foodborne illness risk factors most in need of attention and their corresponding Out of Compliance percentages are:

- Improper Holding/Time and Temperature (42.2%)
- Contaminated Equipment/Protection from Contamination (20.0%)
- Other/Chemical (17.5%)
- Poor Personal Hygiene (16.8%)

Figures S-2 thru S-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in seafood operations to control each of the risk factors during the 2003 data collection.

The other/chemical and food from unsafe sources risk factors all had relatively high IN Compliance percentages. There were a few data items within each of these risk factors that are in need of attention. Information for these data items will be presented as part of the discussion.

Retail Food – SEAFOOD

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Commercially-processed, RTE, PHF date marked	45	55	81.8%
RTE, PHF date marked after 24 hours	18	25	72.0%
** RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F**	9**	18**	50.0%**
PHF held cold at 41 °F or below	17	105	16.2 %
* Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.*	0*	8*	*
* PHF held hot at 140 °F or above*	3*	6*	*
* PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F or below within 4 hours *	2*	5*	*
* PHF cooled to 70 °F on 2 hours/41 °F in total of 6 hours*	1*	2*	*
* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	1*	*
* Roasts are held at a temperature of 130 °F or above*	0*	0*	*

* These six remaining Improper Holding/Time & Temperature Data Items do not appear in Figure S-2 due to a low number of total observations (obs.)

**This data item is included in Figure S-2 even though it has less than twenty total observations. Though there are only a few observations for this data item, it relates directly to the first 2 date marking data items that appear in the Figure.

Retail Food – SEAFOOD

Discussion for Figure S-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Date marking of open containers of commercially-processed, ready-to-eat, PHF (81.8%) and ready-to eat, PHF made on site (72.0%)
- Maintaining cold holding temperatures for PHF (16.2%)

Date Marking

Date marking of refrigerated ready-to-eat, PHF, such as seafood salads that may be prepared or sold, is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that have remained in cold storage beyond the parameters described in the *Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served.

Cold Holding of PHF

Holding PHF at the proper cold temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Retail Food – SEAFOOD

Retail Food - SEAFOOD

Figure S-3
CONTAMINATED EQUIPMENT/PROTECTION FROM CONTAMINATION

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Surfaces/Utensils cleaned/sanitized	37	105	35.2%
Raw/RTE foods, separated	23	98	23.5%
Raw animal foods, separated	16	88	18.2%
Protected from environmental contamination	8	105	7.6%
After being served, food is not re-served	0	23	0.0%

Retail Food – SEAFOOD

Discussion for Figure S-3

The food safety procedures for contaminated equipment/protection from contamination risk factor that are most in need of attention include:

- Cleaning and sanitizing food contact surfaces and utensils (35.2%)
- Separating raw animal foods from ready-to-eat foods (23.5%)
- Separating raw animal foods from each other (18.2%)

Cleaning and Sanitizing

Proper cleaning and sanitization of food contact surfaces is an effective means of preventing cross-contamination. Many different procedures may be involved in the assessment of the management system related to this area. Evaluations should not be restricted to dishwashing procedures but should also include observations on how food preparation tables, cutting boards, and stand-in-place equipment such as slicers and mixers are cleaned and sanitized between uses.

The high Out of Compliance percentage for cleaning and sanitizing food contact surfaces and utensils indicates a weakness in seafood department management systems designed to prevent cross-contamination.

Separation of Raw Animal Foods from Ready-to-Eat Foods

Raw animal foods are a potential source of contamination in any food operation. Storing raw animal foods above or in close proximity to ready-to-eat foods increases the potential for food to become contaminated. To prevent cross-contamination, raw animal foods should also be separated by species based on required minimum cooking temperatures. Required cooking temperatures are based on thermal destruction data and anticipated microbial load. These parameters may vary with different type of raw animal foods. Having organized storage systems that include designated areas for raw animal products will help prevent cross-contamination of foods.

Preventing cross-contamination between raw animal foods and ready-to-eat foods extends to the food preparation area. Designated separate food preparation areas should be provided for raw and ready-to-eat products. If common preparation areas must be used, then procedures must be in place to ensure proper cleaning and sanitizing between uses.

Retail Food – SEAFOOD

Retail Food - SEAFOOD

Figure S-4
POOR PERSONAL HYGIENE

PERCENT (%) of OBSERVATIONS found
Out of Compliance for each DATA ITEM

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
Proper, adequate handwashing	29	77	37.7%
Handwashing facility, cleanser/drying device	17	105	16.2%
Handwashing facility, convenient/accessible	16	105	15.2%
Good hygienic practices	7	89	7.9%
Prevention of hand contamination	5	65	7.7%

Retail Food – SEAFOOD

Discussion for Figure S-4

The food safety procedures for the poor personal hygiene risk factor that are most in need of attention include:

- Proper, adequate handwashing (37.7%)
- Handwashing facility, cleanser/drying device (16.2%)
- Handwashing facility, convenient/accessible (15.2%)

Proper, Adequate Handwashing

Hands may become contaminated when employees engage in activities such as handling raw animal foods, using the restroom or handling soiled tableware. Hands are a common vehicle for the transfer of harmful bacteria and viruses to food products. Effective handwashing is one of the most important measures to minimize the contamination of food by employees. The lack of convenient handwashing facilities and/or supplies of hand cleanser/drying devices may contribute to the lack of proper handwashing. Reinforcing the importance of handwashing should be supported by a management system that includes proper employee training and monitoring of the frequency and effectiveness of handwashing practices.

While handwashing continues to be a primary concern, the results from the 2003 study show a high IN Compliance percentage (92.3%) for preventing direct hand contamination with food in seafood departments. The retail food management in seafood departments appear to be making a concerted effort to eliminate bare hand contact with ready-to-eat foods.

Discussion for the Other/Chemical Risk Factor

Table 27

Assessment of the Other/Chemical Category – SEAFOOD

Poisonous or Toxic Materials are Properly Identified, Stored, and Used

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
20	105	19.0%

All of the Out of Compliance observations relating to the other/chemical risk factor are attributed to one data item. The proper identification, storage, and use of cleaners, sanitizers, and other chemicals in seafood departments are in need of attention. Food safety procedures related to the identification, storage, and use of cleaners, sanitizers, and other chemicals need to be reviewed and

Retail Food – SEAFOOD

revised, if necessary, to address any gaps in the program that may be contributing to the Out of Compliance observations of this data item.

Discussion for the Food from Unsafe Sources

Table 28

Assessment of the Food from Unsafe Sources Risk Factor - SEAFOOD

Shellstock Tags Retained for 90 Days

# Observations OUT	TOTAL Observations (IN & OUT)	% Observations OUT
31	70	44.3%

The overall IN Compliance percentages for data items that comprise the food from unsafe sources risk factor was high indicating effective management of this area. There is one exception to this general observation – retention of shellstock tags for 90 days.

Shellfish harvested from contaminated water can harbor harmful bacteria and viruses. Effective monitoring of shellfish sources must be continuous and involve all segments of the industry. Retention of shellstock tags for 90 days is not a direct contributing factor to the occurrence of foodborne illness. It is, however, an essential management practice that provides a means for conducting tracebacks to the harvest areas should a food-related illness or contamination be associated with shellstock.

Retail Food – SEAFOOD

C. Summary of foodborne illness RISK FACTORS and INDIVIDUAL DATA ITEMS in need of priority attention

RESULTS AND DISCUSSION

Retail Food – PRODUCE

A. Percent of observations found Out of Compliance for each RISK FACTOR

FOODBORNE ILLNESS RISK FACTOR	# OUT	Total Obs. (IN & OUT)	% OUT
Improper Holding/Time & Temperature	99	201	49.3%
Poor Personal Hygiene	72	323	22.3%
Contaminated Equipment/Protection from Contamination	56	273	20.5%
Other/Chemical	24	178	13.5%
Food from Unsafe Sources	4	223	1.8%

* Data for the Inadequate Cook Risk Factor is not reflected in the Figure S-1 due to a low number of observations (obs.)

Retail Food – PRODUCE

Discussion for Figure P-1

Failure to control product holding temperatures and times was the risk factor with the highest Out of Compliance percentage. Poor personal hygiene, contaminated equipment/protection from contamination, and chemical contamination also had notable Out of Compliance percentages. Management systems that were implemented to ensure foods were adequately cooked and from safe sources appeared to be effective when compared to the other risk factors evaluated during this data collection period.

B. Percent of observations found Out of Compliance for each INDIVIDUAL DATA ITEM that comprises a risk factor

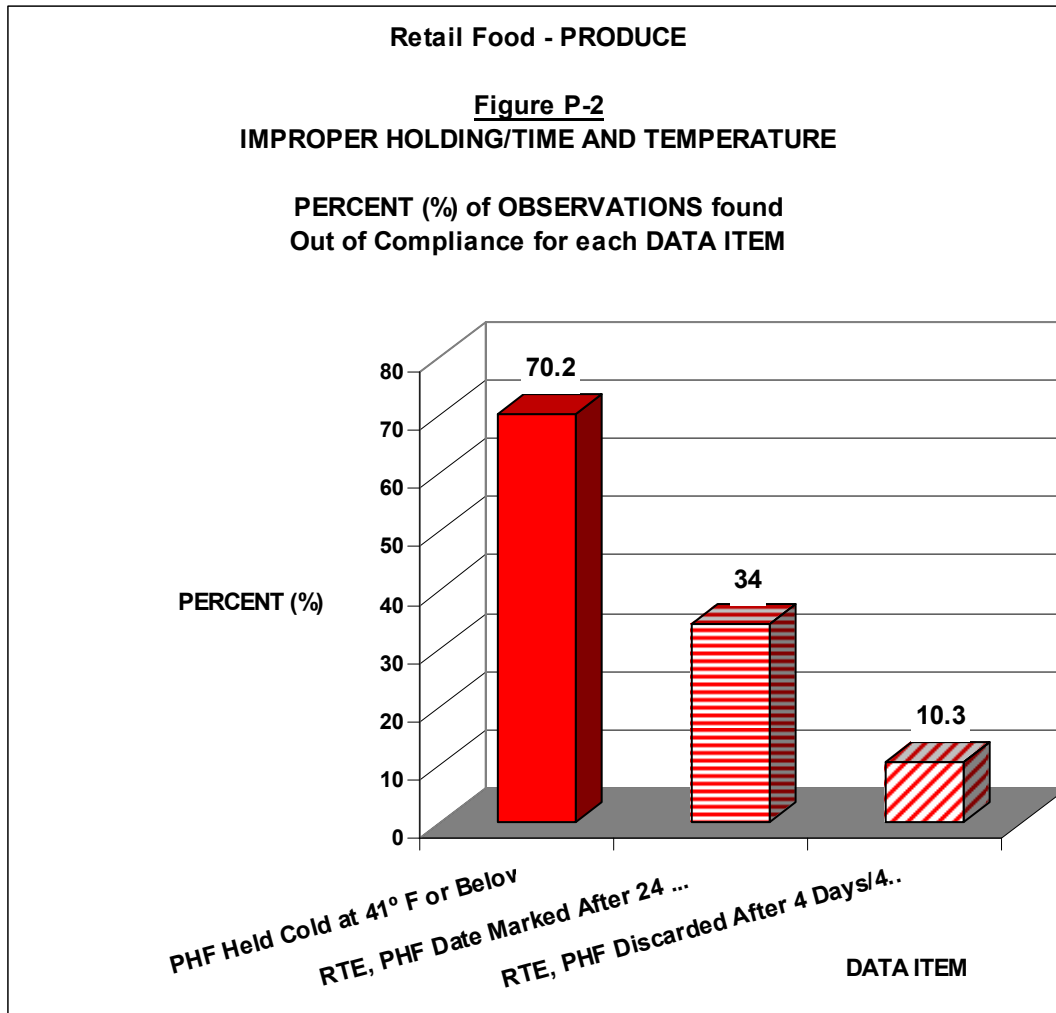

For produce departments, the foodborne illness risk factors most in need of attention and corresponding Out of Compliance percentages are:

- Improper Holding/Time Temperature (49.3%)
- Poor Personal Hygiene (22.3%)
- Contaminated Equipment (20.5%)
- Other/Chemical (13.5%)

Figures P-2 thru P-4 provide a breakdown of each of these risk factors into data items that represent specific food preparation procedures and employee behaviors in need of attention. These figures provide insight into the relative strengths and weaknesses of the food safety management systems in place in produce departments to control each of the risk factors during the 2003 data collection.

In general, the other/chemical risk factor had a high IN Compliance percentage. There was, however, one data item within this risk factor that warrants attention. A summary of the results of the Out of Compliance observations for the identification, storage, and use of chemicals/toxics data item will be presented.

Retail Food – PRODUCE

DATA ITEM	# OUT	Total Obs. (IN & OUT)	% OUT
PHF held cold at 41 °F or below	73	104	70.2%
RTE, PHF date marked after 24 hours	16	47	34.0%
RTE, PHF discarded after 4 days/45 °F or 7 days/41 °F	3	29	10.3%

* When time only is used as a public health control, food is cooked and served within 4 hours*	0*	0*	*
* Roasts are held at a temperature of 130 °F or above*	0*	0*	*
* Foods received at temperatures according to Law are cooled to 41 °F within 4 hours.*	0*	0*	*

* These seven remaining Improper Holding/Time & Temperature Data Items do not appear in Figure P-2 due to a low number of total observations (obs.)

Retail Food – PRODUCE

Discussion for Figure P-2

For the improper holding/time and temperature risk factor, there is a need to review food safety systems related to:

- Maintaining cold holding temperatures for PHF (70.2%)
- Date marking of ready-to eat, PHF made on site (34.0%)

Cold Holding of PHF

Holding PHF at the proper cold temperatures is critical to preventing the growth of bacteria. Equipment, processes, and monitoring procedures related to maintaining temperature control for PHF need to be assessed and corrective action should be taken if necessary.

Date Marking

Date marking of refrigerated ready-to-eat, PHF is an important food safety system component designed to promote proper food rotation and limit the growth of *Listeria monocytogenes* during cold storage. Discarding ready-to-eat, PHF that has remained in cold storage beyond the parameters described in the *Food Code* prevents foods with a harmful level of *Listeria monocytogenes* from being served.

	Handwashing Facility, cleanser/drying Device
Contaminated Equipment/ Protection from Contamination	Surfaces/Utensils cleaned/sanitized
Other/Chemical	Poisonous or toxic materials properly identified, stored, and used

IV. RECOMMENDATIONS

The following recommendations are directed toward enhancing the effectiveness of regulatory and industry retail food protection programs. These recommendations are focused on a nationwide effort to reduce the occurrence of foodborne illness risk factors within institutional foodservice, restaurant and retail food store facilities. Each of the foodborne illness risk factors encompasses a number of food safety practices and employee behaviors. These practices and behaviors are captured by the individual data items in this report and are based on the food safety provisions of the *1997 FDA Food Code*.

Section III, Results and Discussion, emphasized the importance of identifying the gaps in the active managerial control of foodborne illness risk factors for each of the facility types. Active managerial control involves purposefully incorporating specific actions and procedures into a food operation to achieve control over foodborne illness risk factors. If the safety of food is to be significantly improved, foodservice and retail food managers must establish effective control over these food safety practices and employee behaviors.

A. Recommendations for Foodservice and Retail Food Industries

Ultimate responsibility for the development and maintenance of effective food safety systems lies with the management of institutional foodservice, restaurant and retail food store operations. Individual operators responsible for the day-to-day management of these facilities play a key role in preventing foodborne illness.

Food safety management systems can take many forms. Every establishment has some type of a set pattern of procedures, even if it is simply described as “the way we do things.” Some establishments have implemented effective food safety management systems by establishing controls for food preparation methods and monitoring processes common to their operation. Many others, however, rely on vague unmonitored procedures. At a minimum, an operator’s food safety management system should be based on achieving the same level of safety established by the critical limits in the *Food Code*.

The 2000 Baseline Report made the following recommendations for industry to establish active managerial control of foodborne illness risk factors:

- **Develop and implement written Standard Operating Procedures (SOPs)** that address the risk factors. These SOPs should detail procedures specific to the operation for time/temperature control of potentially hazardous food, personal hygiene, and measures to prevent food from being contaminated.
- **Provide the necessary resources, equipment, and supplies** to implement the SOPs. Items such as temperature measurement devices, preferably thermocouples,

test papers, temperature logs, hand soap, towels, and chemical sanitizers are crucial to the successful control of specific risk factors.

- **Assess SOPs to ensure control over all risk factors.** Critical limits and measurable standards for control of the risk factors should be incorporated into SOPs. Critical limits provide a means for measuring the effectiveness of an establishment's food safety procedures.
- **Establish monitoring procedures** that focus on critical processes and practices. Monitoring procedures will only be effective if employees are given the knowledge, skills, and responsibility for food safety.
- **Identify methods to routinely assess the effectiveness of the SOPs.** This assessment approach could be based on an internal review, regulatory inspection results, or third party evaluation.

The importance of each of these recommendations is reinforced by the results of the 2003 data collection effort. The percentage of establishments that were found to be Out of Compliance with data items related to poor personal hygiene, time/temperature control, and contaminated equipment remained high in 2003. This suggests that industry efforts to achieve active managerial control over these risk factors, and to adequately train employees, still needs to be improved. Managing food safety risk factors must be a fully integrated part of every business operation if it is to significantly reduce the risk of foodborne illness.

Section III, Results and Discussion, provides a national overview of the food safety practices and procedures most in need of improvement for each facility type. As a start, industry operators should evaluate how well they are controlling these areas within their own operations. When weaknesses are discovered in the food safety system, action must be initiated to correct the immediate problem and ensure active managerial control of the risk factor.

To assist industry in the development of management systems designed to control foodborne illness risk factors, FDA has developed a guidance document, *Managing Food Safety: A Guide for Voluntary Use of HACCP Principles for Operators of Food Service and Retail Establishments*. The direct FDA web site link to this document is www.cfsan.fda.gov/~dms/hret-toc.html.

B. Recommendations for Regulatory Retail Food Protection Programs

The high percent of establishments found to be Out of Compliance with many of the data items covered in this study indicates that regulatory agencies need to do more to affect change in the food safety practices and behaviors in foodservice and retail food establishments. In conjunction with their industry partners, regulatory agencies should focus their efforts on reducing the occurrence of the risk factors highlighted in Section III of this report. The recommendations below may assist agencies toward this goal.

To assist professionals responsible for regulatory foodservice and retail food inspections, FDA has developed a guidance document, *Managing Food Safety: A Regulator's Guide for Applying HACCP Principles to Risk-Based Retail and Food Service Inspections and Evaluating Voluntary Food Safety Management Systems*. As of the printing date of this report, the guidance document was not available on the FDA web site. A copy can be obtained by contacting one of the FDA Regional Retail Food Specialists listed in Appendix J.

Conducting quality inspections

Inspection focus. The risk factors should be the primary focus of every inspection. Inspectors must understand the public health reasons, and be able to correctly apply the underlying regulatory requirements, for the control of each risk factor.

Inspection tools. Use of an inspection form that directs the inspector to routinely document the compliance status (In, Out, Not Observed, Not Applicable) for practices and behaviors related to the risk factors is recommended. An inspector must also be properly equipped with other necessary inspection tools, such as accurate temperature measuring devices (thermocouples) and sanitizer test kits, to assess an establishment's compliance with certain risk factors.

Inspection timing. The time of day that inspections are conducted may need to be varied based on the operation. Inspectors may need flexible schedules to ensure observations of critical food preparation practices that routinely occur before or after the traditional inspector's working hours. Observing and documenting practices related to risk factors, such as cooling of PHF and proper handwashing, may require slightly longer inspections.

Providing on-site education and achieving voluntary compliance

Recognize any existing industry QA and training programs. Inspectors should recognize an establishment's existing quality assurance and employee training programs and reinforce those components that lead to active managerial control of risk factors.

Establish a dialog with operators. Inspectors should discuss out-of-control risk factors with establishment operators and suggest appropriate control measures.

Obtain immediate corrective action. Inspectors should require immediate corrective action for risk factors found to be Out of Compliance with regulatory requirements. Immediate corrective action should be verified and documented before the inspector leaves the facility.

Assist in developing SOPs and Risk Control Plans. Inspectors should assist operators in developing management plans that describe the specific actions to be taken to achieve long-term control of Out of Compliance risk factors. For example, a risk control plan is a concisely written management plan developed by the retail or foodservice operator with input from the regulatory authority. Risk control plans can be used as both education and compliance tools for addressing out-of-control risk factors.

Implementing a consistent and effective enforcement protocol

Develop enforcement procedures. Well-defined, step-by-step procedures are needed for bringing enforcement actions against facilities that repeatedly fail to achieve compliance with requirements related to foodborne illness risk factors.

Ensure credibility. The enforcement process must be applied fairly and uniformly and with consistency when risk factors are repeatedly out-of-control.

Continuous program improvement

The recommendations described above are captured in the *Voluntary National Retail Food Regulatory Program Standards (Program Standards)*. The Program Standards apply to the operation and management of a retail food regulatory program that is focused on the reduction of foodborne illness risk factors and the promotion of active managerial control of these risk factors. Through a process of self-assessment, agencies may use the Standards to evaluate the effectiveness of their food safety program.

While the Program Standards represent the retail food safety program to which we ultimately aspire, they begin by providing a foundation which all regulatory programs can build upon through a continuous improvement process. Managers of regulatory inspection programs are encouraged to review existing practices and procedures to ensure that current program activities target reducing the occurrence of those risk factors identified in Section III, Reports and Discussion. The *Voluntary National Retail Food Regulatory Program Standards* can be accessed and downloaded from FDA's web site: www.cfsan.fda.gov/~dms/ret.toc.html

The Program Standards encourage state and local jurisdictions to establish studies of the occurrence of foodborne illness risk factors that are specific to their geographic area of responsibility. To assist agencies interested in conducting a baseline study in their own jurisdictions, FDA has prepared a manual and developed a software program designed to manage and analyze the data collected. Information about the data collection manual and software package can be obtained from an FDA Regional Retail Food Specialist.

V. FIELD AND STATISTICAL LIMITATIONS

How a research project is designed and implemented impacts the interpretation of the data. Earlier in this report, some internal and external factors influencing the design and scope of the project were discussed. All field studies involving data analysis have uncontrollable factors that place limitations on how the data is collected, analyzed, and reported. These factors can be placed in two broad categories:

- A. Field Operational Limitations
- B. Statistical Limitations

A. Field Operational Limitations

Attempts were made to observe the same risk-related data items that appear on the data collection form presented under Methodology, Section II, at each establishment. The foodservice and retail food industry is dynamic. There is no set pattern of operation within foodservice and retail food store facilities upon which data collections can be scheduled to be assured of observing all the data items. This results in variations in total number of observations for each of the data items.

The framework that Specialists used to collect the data mirrored the process currently employed by state and local inspectors conducting routine inspections. The factors that impacted the ability of Specialists to observe the specific employee food safety practices and behaviors included establishment type, the season of the year, the time of day the survey was conducted, and the length of time available for each inspection.

Some data items that had a low number of observations included:

- Foods received according to law, cooled to 41 °F (5 °C) within 4 hours
- Cooked PHF cooled from 140 °F (60 °C) to 70 °F (21 °C) within 2 hours and from 140 °F (60 °C) to 41 °F (5 °C) in a total of 6 hours
- PHF (from ambient ingredients) cooled to 41 °F (5 °C) or below within 4 hours
- Roasts, including formed roasts, cooked to 130 °F (54 °C) for 112 minutes
- Wild game animals cooked to 165 °F (74 °C) for 15 seconds
- As required, written documentation of parasite destruction maintained for 90 days for fish products
- Critical Control Point (CCP) monitoring records maintained in accordance with HACCP Plan when required

Some of these data items require a significant period of time to assess compliance with regard to time/temperature standards or they involve processes or operational steps that occur outside traditional regulatory work hours; and documentation of these steps or processes may not have been available at the time of the survey. Other data items related to foods that are not commonly found on the menus of the facility types inspected.

B. Statistical Limitations

Sample Design

Since a random selection of all facility types in the United States would not be possible from a financial or logistical perspective, an alternative method was selected. Comparison sets were developed in five FDA Regions throughout the country. The current picture of compliance with the risk factors reflects the entire U.S. to the extent that the comparison sets are representative of the overall industry.

Because the facilities were not selected randomly from the entire U.S., statistical estimates of the precision with which they estimate the entire U.S. for each facility type cannot be provided. We only have a common sense opinion that being spread across the U.S. in the same pattern that FDA stations its Specialists should give a reasonable approximation of the U.S. compliance picture.

The geographical distribution of Specialists throughout the country in relatively high density population centers allowed for a broad sampling throughout all regions of the U.S. The choice of data collection locations, therefore, was based on the Specialists' geographical areas of responsibility and provided a reasonably convenient design for estimating national risk-related behaviors and practices.

The size of the sample was determined to assure with 95% confidence that if a particular data item has a compliance percentage of no more than 60%, then the study would indicate a compliance rate of no more than 70%.

A challenge inherent in measuring trends is uncontrolled variation in samples. The design of this project controlled this variation by the use of the comparison sets. A typical comparison set consisted of ten or more establishments of the same facility type in the same general geographic area. Where the number of establishments for a facility type within a designated geographic area was small, such as with nursing homes and hospitals, much bigger geographic areas were required than for facility types such as fast food that were more numerous. In areas with limited numbers of nursing homes and hospitals, a comparison set included a minimum of four establishments.

The establishments in each comparison set were placed in alphabetical order and sequentially numbered. The Specialists then used a table of random numbers, supplied by CFSAN's Division of Mathematics, to select the particular establishment to inspect. Comparison set establishment lists, compiled by the Specialists, have been archived and will be used again in future studies. A different establishment is randomly selected from the same comparison set establishment list for each data collection period. This randomness gives the same chance of selecting establishments having varying degrees of compliance, thus preventing selection bias. Since each comparison set is made up of similar establishments, the sample variability is greatly reduced.

This project is designed to establish a national baseline on the occurrence of foodborne illness risk factors within the foodservice and retail food industry. The way the samples were selected and the size of the data set do not support comparisons of individual Specialists geographical areas, states, cities or even regions of the U.S. Not only would it be statistically inappropriate, but such comparisons might be combined with other information, such as the locations of FDA Retail Food Specialists, to identify some of the likely comparison sets. This information would bias future studies.

In addition, the project is not designed to support comparisons of chains of fast food restaurants or chains of grocery stores. There is no statistical justification for looking at reduced sets of results particular to, e.g., two chains of restaurants and drawing conclusions from the differences.

Comparing data over time

A summary of the 1998 Baseline IN Compliance percentages for ALL data items for each facility was presented in Table 1. This report makes no attempt to analyze the difference in IN Compliance percentages between the 1998 and 2003 results. When designing a study to compare just two periods in time, pairing of facilities is considered important. This study made no attempt to satisfy that condition.

Although the data collected in 2003 is part of a larger study designed to measure changes in IN Compliance percentages over time, this data collection period provided only the second data point in the study progression. Since a minimum of three data collection periods is necessary for the measurement of a trend, the results from the 2003 data collection period presented in this report should be interpreted as a stand-alone study.

Having three data collection periods is a necessary condition for the determination of a trend, but it is not a sufficient condition. It is theoretically possible to find a trend with three data collection periods, but the impact of the limitations discussed in this section may make documentation of a trend difficult even with the additional data point. Additional data collection periods may need to be included in the study.

At the beginning of the study design, it was anticipated that the number of observable and applicable responses for each data item would vary. The total number of observations for each data item is likely to change from one data collection period to another. When analyzing data from two data collection periods, the variation in the number of observations makes it difficult to draw statistical conclusions between the overall compliance percentages or the risk factor compliance percentages. Changes in the number of observations of data items may be attributed to:

- Sample variations
- Changes in industry practices
- Quality assurance issues associated with the data collection tool

Sampling variations. The frequency at which a data item can be observed during each data collection period may change due to sampling establishments within the same facility type that have different food products and procedures.

Changes in industry practices. If a change in an overall industry practice results in more inspectors marking not applicable (NA) rather than IN or Out of Compliance, then there may be a change in the total number of observations for a given data item from one data collection period to the next. This may result in a corresponding change in the relative weight of that data item in the compliance percentage for the relevant risk factor. For example, if numerous establishments have shifted from using raw shell eggs to using pasteurized egg products, the number of observations related to inadequate cooking will go down from one data collection period to the next. Therefore, a lower Out of Compliance percentage for the inadequate cook risk factor may not be reported, even though the new industry practice represents improved active managerial control.

Quality assurance. After the 1998 data collection period, a thorough quality assurance review of the marking instructions was conducted for each data item. There were a few data items from the original baseline for which it was necessary to clarify the marking instructions and in one case a slight modification to the data item itself was necessary. Clarifying marking instructions and modifying data items can affect the number of observations for specific data items and in turn the compliance percentages for the risk factors and the overall baseline.

Impact of changes in number of observations from one data collection period to another. Increases or decreases in the number of observations made for a given data item will have an impact on IN Compliance percentages for the corresponding risk factor. All else being equal, a decrease in total observations for a high IN Compliance data item can offset an increase in the IN Compliance percentages for other data items.

For example, consider a risk factor that is comprised of two data items – Item A and Item B. The following chart provides a fictitious summary of observations made of each of the data items in 1998 and 2003.

RISK FACTOR

	1998			2003		
	IN	TOTAL	% IN	IN	TOTAL	% IN
Data Item A	50	100	50%	50	100	50%
Data Item B	100	100	100%	50	50	100%
Overall	150	200	75%	100	150	67%

In the above illustration, Data Item A has the same total number of observations (100) and total number of IN Compliance observations (50) for both 1998 and 2003. For each of these data collection periods the IN Compliance percentage for Data Item A is 50%. Data Item B has a 100% IN Compliance percentage for both 1998 and 2003. In 2003, however, fifty less observations were made of Data Item B.

The IN Compliance percentages for Data Item A (50%) and Data Item B (100%) were exactly the same for both data collection periods. The impact of the fifty less observations for the high IN Compliance data item (B) lowered the overall IN Compliance percentage for the risk factor from 75% in 1998 to 67% in 2003.

If an attempt is made to compare the 2003 IN Compliance percentage (67%) with the 1998 IN Compliance percentage (75%), an erroneous conclusion might be made that the degree of control of this risk factor had regressed by 8%. The underlying cause for the 8% regression, however, is not due to less control of the risk factor but rather a result of fewer observations (fifty less) for data item B which in both data collection periods had an IN Compliance percentage of 100%.

The potential impact of the above scenario on the different data collection periods in this study can be compounded because the Overall IN Compliance percentage upon which trends are being measured is a weighted average of the IN Compliance percentages for forty-two data items. The weights are the number of observations for each data item and are not identical between data collection periods. Therefore, making statistical comparisons between data collection periods becomes difficult. The impact of this weighting issue will be examined for each of the data collection periods.

VI. NEW AREAS OF STUDY

A. IMPACT OF CERTIFIED MANAGERS ON THE CONTROL OF FOODBORNE ILLNESS RISK FACTORS

Minimizing the occurrence of foodborne illness risk factors in a foodservice or retail food operation does not happen by accident. The importance of having knowledgeable and effective management on-site during all hours of operation cannot be overstated. The person in charge of a food establishment is responsible for ensuring that policies and procedures that prevent the transmission of foodborne disease are routinely followed and that corrective actions are taken as needed to protect the health of the consumer.

If the person in charge is knowledgeable about the relationship between the prevention of foodborne illness and the various operations, practices, and behaviors that take place in the food establishment, then he or she will be in a far better position to exert active managerial control over the important foodborne illness risk factors. Encouraging or requiring certification as a food protection manager is one means by which the food industry and regulatory authorities have sought to increase establishment managers' knowledge of food safety.

During the 2003 data collection, Specialists were instructed to determine whether the facility being inspected had a Certified Food Protection Manager on site. For the purposes of this study, Specialists were instructed to circle YES on the Certified Food Protection Manager line on the facility information portion of the Baseline Data Collection Form if the person in charge had been certified by any one of five certification programs whose examinations had been recognized by the Conference for Food Protection (CFP) at the time the data collection effort started. If the person in charge was not a Certified Food Protection Manager or had been certified by an organization not recognized by the CFP, Specialists were instructed to circle NO on the Baseline Data Collection Form.

One reason this information was collected was to get a better picture of the extent to which Certified Food Protection Managers are present in the various facility types during hours of operation. The *Food Code* does not mandate certification but does recognize food protection manager certification by an accredited program as one means by which a person in charge can demonstrate knowledge of foodborne illness prevention, application of HACCP principles and the requirements of the *Food Code*. The number of inspected establishments of each facility type with and without a Certified Food Protection Manager (as determined by the criteria described above) is shown in Table 32.

Table 32

Inspected Facilities With and Without a Certified Food Protection Manager

Facility Type	# Of Inspected Facilities WITH Certified Food Protection Manager	# Of Inspected Facilities WITHOUT Certified Food Protection Manager
Hospitals	80	17
Nursing Homes	54	40
Elementary Schools	56	42
Fast Food Restaurants	71	37
Full Service Restaurants	50	49
Delis	50	58
Meat & Poultry	49	60
Seafood	51	54
Produce	44	64

Impact of Certified Food Protection Managers for each facility type

It appears that the presence of a Certified Food Protection Manager has a positive effect on the overall Percent IN Compliance within some facility types. Four facility types had Overall IN Compliance percentages (all 42 data items combined) that were significantly higher in establishments with a Certified Food Protection Manager than in establishments without a Certified Food Protection Manager. These facility types are identified with **bold type** in Table 33 on page 149. In the five remaining facility types, the differences were not statistically significant¹.

Table 33

**Effect of Manager Certification on the Overall Percent IN Compliance by Facility Type
(2003 Data Collection Form – Sections 1 – 16 (42 Data Items))***

Facility type	Manager Certified			Manager Not Certified			Difference (% IN)

* The figures in Table 33 do not include the Supplemental Data Items found in Sections 17 – 23 of the Data Collection Form (pages 24 – 25)

Effect of Certified Food Protection Managers on the risk factors

Table 34 presents the risk factors for which the Percent IN Compliance for establishments with Certified Food Protection Managers was significantly higher than those without Certified Food Protection Managers.

Table 34

**Risk Factors with Statistically Significant Differences
Between Establishments
WITH and WITHOUT a Certified Food Protection Manager**

Facility Type	Risk Factor
Fast Food Restaurants	<ul style="list-style-type: none"> • Improper Holding/Time and Temperature • Contaminated Equipment/Protection from Contamination
Full Service Restaurants	<ul style="list-style-type: none"> • Poor Personal Hygiene; • Contaminated Equipment/Protection from Contamination
Meat and Poultry Departments	<ul style="list-style-type: none"> • Poor Personal Hygiene
Produce Departments	<ul style="list-style-type: none"> • Poor Personal Hygiene

Specific data for each of the six risk factors are presented in Tables 35 A-F. These tables show the Percent IN Compliance recorded in establishments that had a Certified Food Protection Manager present and those that did not.

There was no risk factor for which the IN Compliance percentage for establishments without a certified manager exceeded the percentage for establishments with a certified manager in a statistically significant manner².

¹ When assessing the statistical significance of the differences between facility types that have certified food protection managers and non certified food protection managers, the Bonferroni adjustment procedure for multiple comparisons was used. This method requires that the probability of committing one or more type 1 errors is .05. Since there are nine facility types, nine comparisons were made resulting in a type 1 error rate to be far smaller than .05 for each comparison. In fact, the p-value required to conclude that a significant difference existed was .0056 or less.

² The same multiple comparison method was used to assess the statistical significance of the differences between risk factors within the different facility types that have certified food protection managers and non-certified food protection managers. Since there are approximately fifty-four comparisons (there are six risk factors for each facility type and nine facility types; however, for several of the risk factors inadequate sample size or violation of the rules relating to the normal approximation of the sampling distribution of the sample proportion made the statistical test inappropriate) we required a p-value of .0005 or less to conclude that a significant difference existed. In this case the probability of committing one or more type 1 errors is .05.

B. SUPPLEMENTAL DATA ITEMS

Although the original forty-two data items used for the 1998 baseline collection were retained in the 2003 data collection, additional data items were added in an effort to gain a better understanding of various industry practices and procedures not addressed in the 1998 baseline collection project. These supplemental data items address practices and procedures related to either foodborne illness risk factors or public health interventions. The following are subject areas that were included in the supplemental data collection:

- Cooking temperatures for pork, ratites, and injected meats
- Hot holding of potentially hazardous food
- Employee health
- Juice treatment
- Cooling and cold holding of raw shell eggs
- Special requirements for establishments serving highly susceptible populations

Cooking Temperatures for Pork, Ratites, and Injected Meats

In the *1997 FDA Food Code* and in the 1998 baseline collection, the critical limit for cooking all pork, ratites such as ostrich and emu, and injected meats was 155 °F (68 °C) for 15 seconds. Subsequent research showed that a lower temperature was adequate for destroying the biological hazards in pork; thus, the critical limit for cooking pork was changed in the *1999 FDA Food Code* to 145 °F (63 °C) for 15 seconds. The critical limit for cooking ratites and injected meats remained unchanged.

Supplemental data items were added to assess whether lowering the cooking temperature of pork had any effect on industry's ability to control this data item. FDA established three separate data items related to the cooking of pork and ratites:

- Cooking of pork, ratites, and injected meats to 155 °F (68 °C) or above for 15 seconds (Data Item – 4G);
- Cooking of pork to 145 °F (63 °C) or above for 15 seconds (Data Items – 17A); and
- Cooking of ratites and injected meats to 155 °F (68 °C) above for 15 seconds (Data Item – 17B).

As shown in Table 36, there were too few observations during the 2003 data collection to make conclusions about what effect, if any, lowering the cooking temperature for pork had on industry's ability to control this data item.

Table 36

Hot Holding Potentially Hazardous Foods at 135 °F (57 °C)

In the 1997 FDA Food Code and in the 1998 baseline collection, the critical limit for hot holding potentially hazardous food was 140 °F (59 °C). This temperature was lowered to 135 °F (57 °C) in the 2003 Food Code Supplement. A supplemental data item was added for hot holding at 135 °F (57 °C) to better assess industry’s practices and procedures related to control of this data item.

As shown in Table 37, changing the hot holding to 135 °F (57 °C) had minimal impact on industry’s control of this data item. There were not enough observations to draw any conclusions for the meat and poultry, seafood, and produce facility types.

Employee Health

The employee health portion of Chapter 2 of the *2001 FDA Food Code* is one of the key public health interventions for preventing foodborne illness resulting from infected food workers. Given the importance of employee health issues in preventing foodborne illness, FDA desires to gain a better understanding of industry practices and procedures related to this public health intervention. Although documentation is not specifically required to demonstrate compliance with Chapter 2 of the *2001 FDA Food Code*, FDA wanted to assess the prevalence of formal, written employee health policies implemented by industry. Specifically, Specialists were instructed to determine if an establishment had a written policy for addressing the following:

- Medical questionnaire upon a conditional offer of employment
- When to exclude or restrict food employees based on illnesses or symptoms
- When to remove exclusions or restrictions
- Responsibility of food employees to report certain illnesses and symptoms to the person in charge
- Responsibility of the person in charge to report illnesses to the regulatory authority

As shown in Table 38, lack of a formal, written employee health policy was noted in all facility types.

Table 38

Juice and Eggs

The *2001 FDA Food Code* includes provisions to address the treatment of packaged juice at the retail level. Specifically, juice packaged at the retail level must be pasteurized or otherwise treated to attain a 5-log reduction of the most pertinent microorganism or bear a warning label. Across all facility types, only thirteen total observations of juice treatment were noted during the 2003 baseline collection. As a result, the sample size for these data items is too small to draw any conclusions.

In addition, the *2001 FDA Food Code* includes provisions to address the cold holding and cooling of raw shell eggs. Specifically, FDA was looking at industry's control of cold holding raw shell eggs at an ambient temperature of 45 °F (7.2 °C) and the cooling of raw shell eggs by being placed under refrigeration at an ambient temperature of 45 °F (7.2 °C) after receipt.

As shown in Table 39, hospitals, nursing homes, elementary schools, fast food restaurants, and full service restaurants appear to have control over the proper cold holding of raw shell eggs. There were not enough observations to make any conclusions about cold holding of raw shell eggs for the other facility types. For the cooling of raw shell eggs, there were not enough observations to draw any conclusion for any of the facility types.

Table 39

Cold Holding of Eggs (Data Item – 22A)

Facility Type	Total IN	Total Out	Total Obs.	Percent IN
Hospitals	75	0	75	100.0%
Nursing Homes	77	2	79	97.5%
Elementary Schools	30	0	30	100.0%
Fast Food Restaurants	29	2	31	93.6%
Full Service Restaurants	71	13	84	84.5%
Delis	18	3	21	85.7%
Meat & Poultry	4	1	5	80.0%
Seafood	0	0	0	---
Produce	11	4	15	73.3%

Highly Susceptible Populations

Lastly, FDA wanted to assess the compliance status of institutions with regard to three specific requirements in the *2001 FDA Food Code* related to the prevention of foodborne illness in highly susceptible populations:

- Prohibiting the service of juice bearing a warning label (untreated or unpasteurized juice) (Data Item – 23A)
- Use of pasteurized eggs (no use of raw shell eggs, with exceptions, as ingredients in certain foods or when combined and cooked) (Data Item – 23B)
- No raw or undercooked animal foods or sprouts served (Data Item – 23C)

As shown in Table 40, there were no Out of Compliance observations in institutional facility types for data item 23A. This indicates managerial control of this item in institutional foodservice settings.

Table 40

**Prepackaged Juice/
Beverage Containing Juice with Warning Label (Data Item – 23A)**

Facility Type	Total IN	Total Out	Total Obs.	Percent IN 23A
Hospitals	96	0	96	100%
Nursing Homes	90	0	90	100%
Elementary Schools	85	0	85	100%

Elementary schools and hospitals appear to have active managerial control over data items 23B (Table 41) and 23C (Table 42) related to the use of pasteurized eggs and no raw or undercooked animal foods being served, respectively. The data suggests that some nursing homes may need to ensure compliance with requirements pertaining to the use of unpasteurized eggs in light of the risk associated with *Salmonella* Enteritidis in undercooked shell eggs.

Table 41

**Pasteurized Eggs or
Eggs Substituted for Raw Shell Eggs (Data Item – 23B)**

Facility Type	Total IN	Total OUT	Total Obs.	Percent IN 23B
Hospitals	71	4	75	94.7%
Nursing Homes	47	18	65	72.3%
Elementary Schools	37	4	41	90.2%

Table 42

**Raw or Partially Cooked Animal Food and
Raw Seed Sprouts not Served (Data Item – 23C)**

Facility Type	Total IN	Total OUT	Total Obs.	Percent IN 23C
Hospitals	90	2	92	97.8%
Nursing Homes	73	10	83	87.9%
Elementary Schools	70	0	70	100%

APPENDICES

APPENDIX A – HOSPITALS

DATA SUMMARY (page 1 of 4)

DATA ITEM #	DATA ITEM	# IN	# OUT	# NO	# NA
Food From Unsafe Sources					
1A	All food from Regulated Food Processing Plants/No Home prepared/canned foods	97	0	0	0
1B	All shellfish from NSSP listed sources. No recreationally caught shellfish received or sold	0	0	0	97
1C	Game, wild mushrooms harvested with approval of Regulatory Authority	0	0	1	96
2A	Food received at proper temperatures/protected from contamination during transportation and receiving/food is safe, unadulterated	96	1	0	0
3A	Shellstock tags/labels retained for 90 days from the date the container is emptied	0	0	0	97
3B	As required, written documentation of parasite destruction maintained for 90 days for fish products	0	0	0	97
3C	CCP monitoring records maintained in accordance with HACCP plan when required	0	0	0	97
Inadequate Cooking					
4A	Raw shell eggs broken for immediate service cooked to 145 °F (63 °C) for 15 seconds. Raw shell eggs broken but not prepared for immediate service cooked to 155 °F (68 °C) for 15 seconds	10	0	57	30
4B	Comminuted Fish, Meats, Game animals cooked to 155 °F (68 °C) for 15 seconds	40	1	54	2
4C	Roasts, including formed roasts, are cooked to 130 °F (54 °C) for 112 minutes or as Chart specified and according to oven parameters per Chart	8	1	76	12
4D	Poultry; stuffed fish, stuffed meat, stuffed pasta, stuffed poultry, stuffed ratites, or stuffing containing fish, meat, poultry or ratites cooked to 165 °F (74 °C) for 15 seconds	40	7	48	2
4E	Wild game animals cooked to 165 °F (74 °C) for 15 seconds	0	0	1	96
4F	Raw animal foods cooked in microwave are rotated, stirred, covered, and heated to 165 °F (74 °C). Food is allowed to stand covered for 2 minutes after cooking	0	0	6	91
4G	Pork, ratites, injected meats are cooked to 155 °F (68 °C) for 15 seconds.	17	1	69	10
4H	All other PHF cooked to 145 °F (63 °C) for 15 seconds	41	0	54	2
5A	PHF that is cooked and cooled on premises is rapidly reheated to 165 °F (74 °C) for 15 seconds for hot holding	30	2	62	3
5B	Food reheated in a microwave is heated to 165 °F (74 °C) or higher	5	1	25	66
5C	Commercially processed ready-to-eat food, reheated to 140 °F (60 °C) or above for hot holding	46	3	45	3
5D	Remaining unsliced portions of roasts are reheated for hot holding using minimum oven parameters	2	0	68	27

APPENDIX A – HOSPITALS

DATA SUMMARY (page 2 of 4)

DATA SUMMARY (page 1 of 4)

DATA ITEM #	DATA ITEM	# IN	# OUT	# NO	# NA
Food From Unsafe Sources					
1A	All food from Regulated Food Processing Plants/No Home prepared/canned foods	108	1	0	0
1B	All shellfish from NSSP listed sources. No recreationally caught shellfish received or sold	11	3	0	95
1C	Game, wild mushrooms harvested with approval of Regulatory Authority	4	0	0	105
2A	Food received at proper temperatures/protected from contamination during transportation and receiving/food is safe, unadulterated	105	4	0	0
3A	Shellstock tags/labels retained for 90 days from the date the container is emptied	2	3	6	98
3B	As required, written documentation of parasite destruction maintained for 90 days for fish products	0	0	0	109
3C	CCP monitoring records maintained in accordance with HACCP plan when required	0	1	0	108
Inadequate Cooking					
4A	Raw shell eggs broken for immediate service cooked to 145 °F (63 °C) for 15 seconds. Raw shell eggs broken but not prepared for immediate service cooked to 155 °F (68 °C) for 15 seconds	0	0	0	109
4B	Comminuted Fish, Meats, Game animals cooked to 155 °F (68 °C) for 15 seconds	0	0	5	104
4C	Roasts, including formed roasts, are cooked to 130 °F (54 °C) for 112 minutes or as Chart specified and according to oven parameters per Chart	0	0	1	108
4D	Poultry; stuffed fish, stuffed meat, stuffed pasta, stuffed poultry, stuffed ratites, or stuffing containing fish, meat, poultry or ratites cooked to 165 °F (74 °C) for 15 seconds	1	1	3	104
4E	Wild game animals cooked to 165 °F (74 °C) for 15 seconds	0	0	0	109
4F	Raw animal foods cooked in microwave are rotated, stirred, covered, and heated to 165 °F (74 °C). Food is allowed to stand covered for 2 minutes after cooking	0	0	0	109
4G	Pork, ratites, injected meats are cooked to 155 °F (68 °C) for 15 seconds.	0	0	5	104
4H	All other PHF cooked to 145 °F (63 °C) for 15 seconds	0	0	5	104
5A	PHF that is cooked and cooled on premises is rapidly reheated to 165 °F (74 °C) for 15 seconds for hot holding	0	0	0	109
5B	Food reheated in a microwave is heated to 165 °F (74 °C) or higher	0	0	0	109
5C	Commercially processed ready-to-eat food, reheated to 140 °F (60 °C) or above for hot holding	0	0	0	109
5D	Remaining unsliced portions of roasts are reheated for hot holding using minimum oven parameters	0	0	0	109

APPENDIX G – MEAT & POULTRY

DATA SUMMARY (page 2 of 4)

DATA ITEM #	DATA ITEM	# IN	# OUT	# NO	# NA
Improper Holding/Time & Temperature					
6A	Cooked PHF is cooled from 140 °F (60 °C) to 70 °F (21 °C) within 2 hours <u>and</u> from 140 °F (60 °C) to 41 °F (5 °C) or below within 6 hours	0	1	3	105
6B	PHF (prepared from ingredients at ambient temperature) is cooled to 41 °F (5 °C) or below within 4 hours	2	0	6	101
6C	Foods received at a temperature according to Law are cooled to 41 °F (5 °C) within 4 hours	1	0	13	101
7A	PHF is maintained at 41 °F (5 °C) or below, except during preparation, cooking, cooling or when time is used as a public health control.	90	19	0	0
8A	PHF is maintained at 140 °F (60 °C) or above, except during preparation, cooking, or cooling or when time is used as a public health control.	0	2	5	102
8B	Roasts are held at a temperature of 130 °F (54 °C) or above	0	0	0	109
9A	Ready-to-eat PHF held for more than 24 hours is date marked as required (prepared on-site)	7	9	0	93
9B	Discard RTE PHF and/or opened commercial container exceeding 7 days at ≤ 41 °F (5 °C) or 4 days at ≤ 45 °F (7 °C)	8	5	14	82
9C	Opened Commercial container of prepared ready-to-eat PHF is date marked as required	5	12	3	89
9D	When time only is used as a public health control, food is cooked and served within 4 hours as required	0	0	1	108
Contaminated Equipment/Protection from Contamination					
10A	Food is protected from cross contamination by separating raw animal foods from raw ready-to-eat food and by separating raw animal foods from cooked ready-to-eat food	61	26	0	22
10B	Raw animal foods are separated from each other during storage, preparation, holding, and display	81	26	0	2
10C	Food is protected from environmental contamination – critical items	100	9	0	0
10D	After being served or sold to a consumer, food is not re-served	26	0	23	60
11A	Food-contact surfaces and utensils are clean to sight and touch and sanitized before use	63	46	0	0
