Other biomarkers with potential clinical significance

DNMT3A R882H #

TP53 S127F #

#Variants in this gene may be derived from a nontumor source such as clonal hematopoiesis (CH). The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.

Please refer to appendix for Explanation of Clinical Significance Classification and for variants of unknown significance (VUS).

ABOUT THE TEST Foundation One® Liquid CDx is a next generation sequencing (NGS) assay that identifies clinically relevant genomic alterations in circulating cell-free DNA.

APPENDIX

About FoundationOne®Liquid CDx

INTENDED USE

FoundationOne Liquid CDx is a qualitative next generation sequencing based in vitro diagnostic test that uses targeted high throughput hybridization-based capture technology to detect and report substitutions, insertions and deletions (indels) in 311 genes, rearrangements in three (3) genes, and copy number alterations in three (3) genes. FoundationOne Liquid CDx utilizes circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood of cancer patients collected in FoundationOne Liquid CDx cfDNA blood collection tubes included in the FoundationOne Liquid CDx Blood Sample Collection Kit. The test is intended to be used as a companion diagnostic to identify patients who may benefit from treatment with the targeted therapies listed in Table 1 in accordance with the approved therapeutic product labeling.

Additionally, FoundationOne Liquid CDx is intended to provide tumor mutation profiling to be used by qualified health care professionals in accordance with professional guidelines in oncology for patients with solid malignant neoplasms.

A negative result from a plasma specimen does not mean that the patient's tumor is negative for genomic findings. Patients with the tumor types above who are negative for the mutations listed in Table 1 should be reflexed to routine biopsy and their tumor mutation status confirmed using an FDA-approved tumor tissue test, if feasible.

Genomic findings other than those listed in Table 1 are not prescriptive or conclusive for labeled use of any specific therapeutic product.

FoundationOne Liquid CDx is a single-site assay performed at Foundation Medicine, Inc. in Cambridge, MA.

TABLE 1: COMPANION DIAGNOSTIC INDICATIONS

INDICATION	BIOMARKER	THERAPY
Breast cancer	PIK3CA mutations	PIQRAY® (alpelisib)
Non-small cell lung cancer (NSCLC)	ALK rearrangements	ALECENSA® (alectinib)
	EGFR exon 19 deletions and EGFR exon 21 L858R alterations	IRESSA® (gefitinib) TAGRISSO® (osimertinib) TARCEVA® (erlotinib)
	MET single nucleotide variants (SNVs) and indels that lead to MET exon 14 skipping	TABRECTA® (capmatinib)
	ROS1 rearrangements	ROZLYTREK® (entrectinib)
Ovarian cancer	BRCA1, BRCA2 alterations	RUBRACA® (rucaparib)
Prostate cancer	BRCA1, BRCA2 alterations	RUBRACA* (rucaparib)

APPENDIX

About FoundationOne®Liquid CDx

TEST PRINCIPLE

The FoundationOne Liquid CDx assay is performed exclusively as a laboratory service using circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood from patients with solid malignant neoplasms. The assay employs a single DNA extraction method to obtain cfDNA from plasma from whole blood. Extracted cfDNA undergoes whole-genome shotgun library construction and hybridization-based capture of 324 cancer-related genes. All coding exons of 309 genes are targeted; select intronic or non-coding regions are targeted in fifteen of these genes (refer to Table 2 for the complete list of genes reported by FoundationOne Liquid CDx). Hybrid-capture selected libraries are sequenced with deep coverage using the NovaSeq® 6000 platform. Sequence data are processed using a custom analysis pipeline designed to detect genomic alterations, including base substitutions and indels in 311 genes, copy number variants in three genes, and genomic rearrangements in four genes. A subset of targeted regions in 75 genes is baited for enhanced sensitivity.

PERFORMANCE CHARACTERISTICS

Please refer to product label: foundationmedicine.com/F1LCDx

WARNINGS AND PRECAUTIONS

- 1. Alterations reported may include somatic (not inherited) or germline (inherited) alterations; however, the test does not distinguish between germline and somatic alterations. If a reported alteration is suspected to be germline, confirmatory testing should be considered in the appropriate clinical context.
- **2.** The test is not intended to replace germline testing or to provide information about cancer predisposition.
- Patients for whom no companion diagnostic alterations are detected should be considered for confirmation with an FDA-approve tumor tissue test, if possible.

LIMITATIONS

- 1. For in vitro diagnostic use.
- **2.** For prescription use only. This test must be ordered by a qualified medical professional in accordance with clinical laboratory regulations.
- **3.** Genomic findings other than those listed in Table 1 of the intended use are not prescriptive or conclusive for labeled use of any specific therapeutic product.
- **4.** A negative result does not rule out the presence of a mutation in the patient's tumor.
- **5.** Decisions on patient care and treatment must be based on the independent medical judgment of the treating physician, taking into consideration all applicable information

- concerning the patient's condition, such as patient and family history, physical examinations, information from other diagnostic tests, and patient preferences, in accordance with the standard of care in a given given community.
- **6.** The test is intended to be performed on specific serial number-controlled instruments by Foundation Medicine, Inc.
- 7. Genomic findings from circulating cell-free DNA (cfDNA) may originate from circulating tumor DNA fragments, germline alterations, or nontumor somatic alterations, such as clonal hematopoiesis (CH). Genes with alterations that may be derived from CH include, but are not limited to, the following: ASXL1, ATM, CBL, CHEK2, DNMT3A, JAK2, KMT2D (MLL2), MPL, MYD88, SF3B1, TET2, TP53, and U2AF1. The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.
- **8.** The false positive rate of this test was evaluated in healthy donors. The detection rate for unique short variants in apparently healthy patients is 0.82%. Across 30,622 short variants, 58 variants had a detection rate of greater than 5%.
- **9.** The analytical accuracy for the FoundationOne Liquid CDx assay has not been demonstrated in all genes.
- 10. The analytical accuracy for the FoundationOne Liquid CDx assay for the detection of SNVs and indels that lead to MET exon 14 skipping has not been demonstrated for samples with variant allele frequencies (VAF) below 0.34% for base substitutions and 0.73% VAF for small insertions and small deletions.
- 11. TABRECTA® efficacy has not been established in patients with MET single nucleotide variants (SNVs) <0.21% VAF and in patients with MET indels <0.16% VAF tested with FoundationOne Liquid CDx.
- **12.** The precision of FoundationOne Liquid CDx was only confirmed for select variants at the limit of detection.
- **13.** The FoundationOne Liquid CDx assay does not detect heterozygous deletions.
- **14.** The FoundationOne Liquid CDx assay does not detect copy number losses/homozygous deletions in *ATM*.
- **15.** A complete assessment of the impact of cfDNA blood collection tube lot-to-lot variability on the performance of the test has not been evaluated.
- **16.** The test is not intended to provide information on cancer predisposition.
- **17.** BRCA1/BRCA2 homozygous deletions and rearrangements were not adequately represented in all analytical studies.
- **18.** Performance has not been validated for cfDNA input below the specified minimum input.

19. Representation of SNV and indels that lead to *MET* exon 14 skipping that represent biomarker rule category 1 and 2, were limited in the analytical validation studies.

LEVEL 1: COMPANION DIAGNOSTICS (CDX)

Clinical evidence should be presented from a prospectively designed clinical trial. Results can also be presented from a retrospective clinical bridging study demonstrating that the clinical endpoints are preserved using plasma samples in trials where enrollment was based on tissue test results. For follow-on markers, a clinical concordance study demonstrating non-inferiority to the original FDA-approved cfDNA-based companion diagnostic device (refer to Li, Meijuan. Statistical Methods for Clinical Validation of Follow-On Companion Diagnostic Devices via an External Concordance Study. Statistics in Biopharmaceutical Research. 8: 35-363, 2016) is required. In addition to the clinical validation, analytical validation for each specific Level 1 CDx biomarker should be presented.

LEVEL 2: cfDNA BIOMARKERS WITH STRONG EVIDENCE OF CLINICAL SIGNIFICANCE IN cfDNA

For a Level 2 claim of cfDNA biomarkers with strong evidence of clinical significance, clinical validation needs to be from evidence presented with FDA-approved liquid biopsy companion diagnostic biomarkers for the specific tumor type at the biomarker or variant level. Such claims should also be supported by analytical performance for each biomarker from at least LoD, precision/reproducibility, and accuracy studies.

LEVEL 3A: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY STRONG ANALYTICAL VALIDATION USING CFDNA AND CONCORDANCE BETWEEN CFDNA AND TISSUE

Clinical evidence can be provided from tissue-based companion diagnostics. This should also be supported by analytical validation (LoD, precision, analytical accuracy, and concordance study to a tissue-based test) for the specific tumor type at the biomarker or variant level, using a representative approach for SNVs and indels. Evidence evaluating concordance between cfDNA- and tissue-samples for FDA-approved tissue markers should be demonstrated using an FDA-approved tissue test or a validated tissue test.

TUMOR TYPE Lung non-small cell lung carcinoma (NOS)

APPENDIX

About FoundationOne®Liquid CDx

ORDERED TEST #

LEVEL 3B: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY ANALYTICAL VALIDATION USING cfDNA

Clinical evidence can be provided from tissuebased companion diagnostics, with analytical validity supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).

LEVEL 4: OTHER BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Biomarkers not categorized into Levels 1, 2, or 3 can be included under Level 4 for informational purposes or to be used to direct patients toward clinical trials for which they may be eligible. Such claims can be supported by clinical rationale for inclusion in the panel. Such rationale could also include peer-reviewed publications for genes/variants in tissue, variant information from well-curated public databases, or *in vitro* pre-clinical models. Analytical validation should be supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).

About FoundationOne®Liquid CDx

ORDERED TEST #

LEVEL 3B: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY ANALYTICAL VALIDATION USING cfDNA

Clinical evidence can be provided from tissuebased companion diagnostics, with analytical validity supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).

LEVEL 4: OTHER BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Biomarkers not categorized into Levels 1, 2, or 3 can be included under Level 4 for informational purposes or to be used to direct patients toward clinical trials for which they may be eligible. Such claims can be supported by clinical rationale for inclusion in the panel. Such rationale could also include peer-reviewed publications for genes/variants in tissue, variant information from well-curated public databases, or *in vitro* pre-clinical models. Analytical validation should be supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).

MR Suite Version o.o.o

APPENDIX

Genes assayed in FoundationOne®Liquid CDx

Table 2: As part of its FDA-approved intended use, the FoundationOne Liquid CDx assay interrogates 324 genes, including 309 genes with complete exonic (coding) coverage and 15 genes with only select noncoding coverage (indicated with an *). Select regions in 75 genes (indicated in bold) are captured with increased sensitivity. Genes are captured for increased sensitivity with complete exonic (coding) coverage unless otherwise noted.

FDA-Approved Content

Companion Diagnostic (CDx) Findings

A companion diagnostic provides essential information for the safe and effective use of a corresponding drug or biological product. This table contains therapies associated with FoundationOne®Liquid CDx's FDA-approved companion diagnostic indications.

GENOMIC FINDINGS	CDx-INDICATED THERAPIES
EGFR exon 19 deletion (L747_P753>S)	TAGRISSO® (osimertinib) TARCEVA® (erlotinib) IRESSA® (gefitinib)

Tumor Profiling Results

FoundationOne®Liquid CDx is FDA-approved to provide tumor mutation profiling results for oncology patients with solid tumors.

SHORT VARIANTS AND SELECT REARRANGEMENTS AND COPY NUMBER ALTERATIONS IDENTIFIED

Results reported in this section that are not designated as CDx findings are not prescriptive or conclusive for labeled use of any specific therapeutic product. See *professional* services section for information on the alterations listed in this section as well as any additional detected copy number alterations, gene rearrangements, or biomarkers. Please refer to the appendix for the description of the biomarker levels.

Companion diagnostic (CDx) findings

EGFR exon 19 deletion (L747_P753>S)

cfDNA biomarkers with strong evidence of clinical significance in cfDNA

Other biomarkers with potential clinical significance

ASXL1 A640fs*14 #

DNMT3A F290fs*22 #

POTENTIAL RESISTANCE

While this patient has a CDx-positive finding, a co-occurring alteration identified may confer resistance to a therapy indicated above.

#Variants in this gene may be derived from a nontumor source such as clonal hematopoiesis (CH). The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.

Please refer to appendix for Explanation of Clinical Significance Classification and for variants of unknown significance (VUS).

ABOUT THE TEST FoundationOne®Liquid CDx is a next generation sequencing (NGS) assay that identifies clinically relevant genomic alterations in circulating cell-free DNA.

TUMOR TYPE
Lung non-small cell lung
carcinoma (NOS)

APPENDIX

About FoundationOne®Liquid CDx

ORDERED TEST #

INTENDED USE

FoundationOne Liquid CDx is a qualitative next generation sequencing based in vitro diagnostic test that uses targeted high throughput hybridization-based capture technology to detect and report substitutions, insertions and deletions (indels) in 311 genes, rearrangements in three (3) genes, and copy number alterations in three (3) genes. FoundationOne Liquid CDx utilizes circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood of cancer patients collected in FoundationOne Liquid CDx cfDNA blood collection tubes included in the FoundationOne Liquid CDx Blood Sample Collection Kit. The test is intended to be used as a companion diagnostic to identify patients who may benefit from treatment with the targeted therapies listed in Table 1 in accordance with the approved therapeutic product labeling.

Additionally, FoundationOne Liquid CDx is intended to provide tumor mutation profiling to be used by qualified health care professionals in accordance with professional guidelines in oncology for patients with solid malignant neoplasms.

A negative result from a plasma specimen does not mean that the patient's tumor is negative for genomic findings. Patients with the tumor types above who are negative for the mutations listed in Table 1 should be reflexed to routine biopsy and their tumor mutation status confirmed using an FDA-approved tumor tissue test, if feasible.

Genomic findings other than those listed in Table 1 are not prescriptive or conclusive for labeled use of any specific therapeutic product.

FoundationOne Liquid CDx is a single-site assay performed at Foundation Medicine, Inc. in Cambridge, MA.

TABLE 1: COMPANION DIAGNOSTIC INDICATIONS

INDICATION	BIOMARKER	THERAPY
Breast cancer	PIK3CA mutations	PIQRAY® (alpelisib)
	ALK rearrangements	ALECENSA® (alectinib)
Non-small cell	EGFR exon 19 deletions and EGFR exon 21 L858R alterations	IRESSA* (gefitinib) TAGRISSO* (osimertinib) TARCEVA* (erlotinib)
lung cancer (NSCLC)	MET single nucleotide variants (SNVs) and indels that lead to MET exon 14 skipping	TABRECTA® (capmatinib)
	ROS1 rearrangements	ROZLYTREK® (entrectinib)
Ovarian cancer	BRCA1, BRCA2 alterations	RUBRACA® (rucaparib)
Prostate cancer	BRCA1, BRCA2 alterations	RUBRACA® (rucaparib)

APPENDIX

About FoundationOne®Liquid CDx

TEST PRINCIPLE

The FoundationOne Liquid CDx assay is performed exclusively as a laboratory service using circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood from patients with solid malignant neoplasms. The assay employs a single DNA extraction method to obtain cfDNA from plasma from whole blood. Extracted cfDNA undergoes whole-genome shotgun library construction and hybridization-based capture of 324 cancer-related genes. All coding exons of 309 genes are targeted; select intronic or non-coding regions are targeted in fifteen of these genes (refer to Table 2 for the complete list of genes reported by FoundationOne Liquid CDx). Hybrid-capture selected libraries are sequenced with deep coverage using the NovaSeq® 6000 platform. Sequence data are processed using a custom analysis pipeline designed to detect genomic alterations, including base substitutions and indels in 311 genes, copy number variants in three genes, and genomic rearrangements in four genes. A subset of targeted regions in 75 genes is baited for enhanced sensitivity.

PERFORMANCE CHARACTERISTICS

Please refer to product label: foundationmedicine.com/F1LCDx

WARNINGS AND PRECAUTIONS

- 1. Alterations reported may include somatic (not inherited) or germline (inherited) alterations; however, the test does not distinguish between germline and somatic alterations. If a reported alteration is suspected to be germline, confirmatory testing should be considered in the appropriate clinical context.
- **2.** The test is not intended to replace germline testing or to provide information about cancer predisposition.
- Patients for whom no companion diagnostic alterations are detected should be considered for confirmation with an FDA-approve tumor tissue test, if possible.

LIMITATIONS

- 1. For in vitro diagnostic use.
- **2.** For prescription use only. This test must be ordered by a qualified medical professional in accordance with clinical laboratory regulations.
- **3.** Genomic findings other than those listed in Table 1 of the intended use are not prescriptive or conclusive for labeled use of any specific therapeutic product.
- **4.** A negative result does not rule out the presence of a mutation in the patient's tumor.
- **5.** Decisions on patient care and treatment must be based on the independent medical judgment of the treating physician, taking into consideration all applicable information

- concerning the patient's condition, such as patient and family history, physical examinations, information from other diagnostic tests, and patient preferences, in accordance with the standard of care in a given given community.
- **6.** The test is intended to be performed on specific serial number-controlled instruments by Foundation Medicine, Inc.
- 7. Genomic findings from circulating cell-free DNA (cfDNA) may originate from circulating tumor DNA fragments, germline alterations, or nontumor somatic alterations, such as clonal hematopoiesis (CH). Genes with alterations that may be derived from CH include, but are not limited to, the following: ASXL1, ATM, CBL, CHEK2, DNMT3A, JAK2, KMT2D (MLL2), MPL, MYD88, SF3B1, TET2, TP53, and U2AF1. The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.
- **8.** The false positive rate of this test was evaluated in healthy donors. The detection rate for unique short variants in apparently healthy patients is 0.82%. Across 30,622 short variants, 58 variants had a detection rate of greater than 5%.
- **9.** The analytical accuracy for the FoundationOne Liquid CDx assay has not been demonstrated in all genes.
- 10. The analytical accuracy for the FoundationOne Liquid CDx assay for the detection of SNVs and indels that lead to MET exon 14 skipping has not been demonstrated for samples with variant allele frequencies (VAF) below 0.34% for base substitutions and 0.73% VAF for small insertions and small deletions.
- 11. TABRECTA® efficacy has not been established in patients with MET single nucleotide variants (SNVs) <0.21% VAF and in patients with MET indels <0.16% VAF tested with FoundationOne Liquid CDx.
- **12.** The precision of FoundationOne Liquid CDx was only confirmed for select variants at the limit of detection.
- **13.** The FoundationOne Liquid CDx assay does not detect heterozygous deletions.
- **14.** The FoundationOne Liquid CDx assay does not detect copy number losses/homozygous deletions in *ATM*.
- 15. A complete assessment of the impact of cfDNA blood collection tube lot-to-lot variability on the performance of the test has not been evaluated.
- **16.** The test is not intended to provide information on cancer predisposition.
- **17.** BRCA1/BRCA2 homozygous deletions and rearrangements were not adequately represented in all analytical studies.
- **18.** Performance has not been validated for cfDNA input below the specified minimum input.

19. Representation of SNV and indels that lead to *MET* exon 14 skipping that represent biomarker rule category 1 and 2, were limited in the analytical validation studies.

LEVEL 1: COMPANION DIAGNOSTICS (CDX)

Clinical evidence should be presented from a prospectively designed clinical trial. Results can also be presented from a retrospective clinical bridging study demonstrating that the clinical endpoints are preserved using plasma samples in trials where enrollment was based on tissue test results. For follow-on markers, a clinical concordance study demonstrating non-inferiority to the original FDA-approved cfDNA-based companion diagnostic device (refer to Li, Meijuan. Statistical Methods for Clinical Validation of Follow-On Companion Diagnostic Devices via an External Concordance Study. Statistics in Biopharmaceutical Research. 8: 35-363, 2016) is required. In addition to the clinical validation, analytical validation for each specific Level 1 CDx biomarker should be presented.

LEVEL 2: cfDNA BIOMARKERS WITH STRONG EVIDENCE OF CLINICAL SIGNIFICANCE IN cfDNA

For a Level 2 claim of cfDNA biomarkers with strong evidence of clinical significance, clinical validation needs to be from evidence presented with FDA-approved liquid biopsy companion diagnostic biomarkers for the specific tumor type at the biomarker or variant level. Such claims should also be supported by analytical performance for each biomarker from at least LoD, precision/reproducibility, and accuracy studies.

LEVEL 3A: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY STRONG ANALYTICAL VALIDATION USING CFDNA AND CONCORDANCE BETWEEN CFDNA AND TISSUE

Clinical evidence can be provided from tissue-based companion diagnostics. This should also be supported by analytical validation (LoD, precision, analytical accuracy, and concordance study to a tissue-based test) for the specific tumor type at the biomarker or variant level, using a representative approach for SNVs and indels. Evidence evaluating concordance between cfDNA- and tissue-samples for FDA-approved tissue markers should be demonstrated using an FDA-approved tissue test or a validated tissue test.

Companion Diagnostic (CDx) Findings

A companion diagnostic provides essential information for the safe and effective use of a corresponding drug or biological product. This table contains therapies associated with FoundationOne®Liquid CDx's FDA-approved companion diagnostic indications.

GENOMIC FINDINGS

CDx-INDICATED THERAPIES

No Companion Diagnostic (CDx) alterations for FoundationOne*Liquid CDx were detected. Please consider confirmation with tumor tissue testing, such as FoundationOne*CDx, if possible.

Tumor Profiling Results

FoundationOne®Liquid CDx is FDA-approved to provide tumor mutation profiling results for oncology patients with solid tumors.

SHORT VARIANTS AND SELECT REARRANGEMENTS AND COPY NUMBER ALTERATIONS IDENTIFIED

Results reported in this section that are not designated as CDx findings are not prescriptive or conclusive for labeled use of any specific therapeutic product. See *professional* services section for information on the alterations listed in this section as well as any additional detected copy number alterations, gene rearrangements, or biomarkers. Please refer to the appendix for the description of the biomarker levels.

Biomarkers with evidence of clinical significance in tissue supported by analytical validation using cfDNA

BRCA1 R71G

Other biomarkers with potential clinical significance

ESR1 Y537C **TP53** Y220C **

HSD3B1 T353M **TP53** splice site 345_375+9>GTTGG[#]

#Variants in this gene may be derived from a nontumor source such as clonal hematopoiesis (CH). The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.

Please refer to appendix for Explanation of Clinical Significance Classification and for variants of unknown significance (VUS).

ABOUT THE TEST FoundationOne®Liquid CDx is a next generation sequencing (NGS) assay that identifies clinically relevant genomic alterations in circulating cell-free DNA.

TUMOR TYPE
Breast invasive ductal carcinoma (IDC)

APPENDIX

About FoundationOne®Liquid CDx

ORDERED TEST #

INTENDED USE

FoundationOne Liquid CDx is a qualitative next generation sequencing based in vitro diagnostic test that uses targeted high throughput hybridization-based capture technology to detect and report substitutions, insertions and deletions (indels) in 311 genes, rearrangements in three (3) genes, and copy number alterations in three (3) genes. FoundationOne Liquid CDx utilizes circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood of cancer patients collected in FoundationOne Liquid CDx cfDNA blood collection tubes included in the FoundationOne Liquid CDx Blood Sample Collection Kit. The test is intended to be used as a companion diagnostic to identify patients who may benefit from treatment with the targeted therapies listed in Table 1 in accordance with the approved therapeutic product labeling.

Additionally, FoundationOne Liquid CDx is intended to provide tumor mutation profiling to be used by qualified health care professionals in accordance with professional guidelines in oncology for patients with solid malignant neoplasms.

A negative result from a plasma specimen does not mean that the patient's tumor is negative for genomic findings. Patients with the tumor types above who are negative for the mutations listed in Table 1 should be reflexed to routine biopsy and their tumor mutation status confirmed using an FDA-approved tumor tissue test, if feasible.

Genomic findings other than those listed in Table 1 are not prescriptive or conclusive for labeled use of any specific therapeutic product.

FoundationOne Liquid CDx is a single-site assay performed at Foundation Medicine, Inc. in Cambridge, MA.

TABLE 1: COMPANION DIAGNOSTIC INDICATIONS

INDICATION	BIOMARKER	THERAPY					
Breast cancer	PIK3CA mutations	PIQRAY® (alpelisib)					
	ALK rearrangements	ALECENSA® (alectinib)					
Non-small cell	EGFR exon 19 deletions and EGFR exon 21 L858R alterations	IRESSA* (gefitinib) TAGRISSO* (osimertinib) TARCEVA* (erlotinib)					
lung cancer (NSCLC)	MET single nucleotide variants (SNVs) and indels that lead to MET exon 14 skipping	TABRECTA® (capmatinib)					
	ROS1 rearrangements	ROZLYTREK® (entrectinib)					
Ovarian cancer	BRCA1, BRCA2 alterations	RUBRACA® (rucaparib)					
Prostate cancer	BRCA1, BRCA2 alterations	RUBRACA* (rucaparib)					

APPENDIX

About FoundationOne®Liquid CDx

TEST PRINCIPLE

The FoundationOne Liquid CDx assay is performed exclusively as a laboratory service using circulating cell-free DNA (cfDNA) isolated from plasma derived from anti-coagulated peripheral whole blood from patients with solid malignant neoplasms. The assay employs a single DNA extraction method to obtain cfDNA from plasma from whole blood. Extracted cfDNA undergoes whole-genome shotgun library construction and hybridization-based capture of 324 cancer-related genes. All coding exons of 309 genes are targeted; select intronic or non-coding regions are targeted in fifteen of these genes (refer to Table 2 for the complete list of genes reported by FoundationOne Liquid CDx). Hybrid-capture selected libraries are sequenced with deep coverage using the NovaSeq® 6000 platform. Sequence data are processed using a custom analysis pipeline designed to detect genomic alterations, including base substitutions and indels in 311 genes, copy number variants in three genes, and genomic rearrangements in four genes. A subset of targeted regions in 75 genes is baited for enhanced sensitivity.

PERFORMANCE CHARACTERISTICS

Please refer to product label: foundationmedicine.com/F1LCDx

WARNINGS AND PRECAUTIONS

- 1. Alterations reported may include somatic (not inherited) or germline (inherited) alterations; however, the test does not distinguish between germline and somatic alterations. If a reported alteration is suspected to be germline, confirmatory testing should be considered in the appropriate clinical context.
- **2.** The test is not intended to replace germline testing or to provide information about cancer predisposition.
- Patients for whom no companion diagnostic alterations are detected should be considered for confirmation with an FDA-approve tumor tissue test, if possible.

LIMITATIONS

- 1. For in vitro diagnostic use.
- **2.** For prescription use only. This test must be ordered by a qualified medical professional in accordance with clinical laboratory regulations.
- **3.** Genomic findings other than those listed in Table 1 of the intended use are not prescriptive or conclusive for labeled use of any specific therapeutic product.
- **4.** A negative result does not rule out the presence of a mutation in the patient's tumor.
- **5.** Decisions on patient care and treatment must be based on the independent medical judgment of the treating physician, taking into consideration all applicable information

- concerning the patient's condition, such as patient and family history, physical examinations, information from other diagnostic tests, and patient preferences, in accordance with the standard of care in a given given community.
- **6.** The test is intended to be performed on specific serial number-controlled instruments by Foundation Medicine, Inc.
- 7. Genomic findings from circulating cell-free DNA (cfDNA) may originate from circulating tumor DNA fragments, germline alterations, or nontumor somatic alterations, such as clonal hematopoiesis (CH). Genes with alterations that may be derived from CH include, but are not limited to, the following: ASXL1, ATM, CBL, CHEK2, DNMT3A, JAK2, KMT2D (MLL2), MPL, MYD88, SF3B1, TET2, TP53, and U2AF1. The efficacy of targeting such nontumor somatic alterations (e.g., CH) is unknown.
- **8.** The false positive rate of this test was evaluated in healthy donors. The detection rate for unique short variants in apparently healthy patients is 0.82%. Across 30,622 short variants, 58 variants had a detection rate of greater than 5%.
- **9.** The analytical accuracy for the FoundationOne Liquid CDx assay has not been demonstrated in all genes.
- 10. The analytical accuracy for the FoundationOne Liquid CDx assay for the detection of SNVs and indels that lead to MET exon 14 skipping has not been demonstrated for samples with variant allele frequencies (VAF) below 0.34% for base substitutions and 0.73% VAF for small insertions and small deletions.
- 11. TABRECTA® efficacy has not been established in patients with MET single nucleotide variants (SNVs) <0.21% VAF and in patients with MET indels <0.16% VAF tested with FoundationOne Liquid CDx.
- **12.** The precision of FoundationOne Liquid CDx was only confirmed for select variants at the limit of detection.
- **13.** The FoundationOne Liquid CDx assay does not detect heterozygous deletions.
- **14.** The FoundationOne Liquid CDx assay does not detect copy number losses/homozygous deletions in *ATM*.
- **15.** A complete assessment of the impact of cfDNA blood collection tube lot-to-lot variability on the performance of the test has not been evaluated.
- **16.** The test is not intended to provide information on cancer predisposition.
- **17.** BRCA1/BRCA2 homozygous deletions and rearrangements were not adequately represented in all analytical studies.
- **18.** Performance has not been validated for cfDNA input below the specified minimum input.

19. Representation of SNV and indels that lead to *MET* exon 14 skipping that represent biomarker rule category 1 and 2, were limited in the analytical validation studies.

LEVEL 1: COMPANION DIAGNOSTICS (CDX)

Clinical evidence should be presented from a prospectively designed clinical trial. Results can also be presented from a retrospective clinical bridging study demonstrating that the clinical endpoints are preserved using plasma samples in trials where enrollment was based on tissue test results. For follow-on markers, a clinical concordance study demonstrating non-inferiority to the original FDA-approved cfDNA-based companion diagnostic device (refer to Li, Meijuan. Statistical Methods for Clinical Validation of Follow-On Companion Diagnostic Devices via an External Concordance Study. Statistics in Biopharmaceutical Research. 8: 35-363, 2016) is required. In addition to the clinical validation, analytical validation for each specific Level 1 CDx biomarker should be presented.

LEVEL 2: cfDNA BIOMARKERS WITH STRONG EVIDENCE OF CLINICAL SIGNIFICANCE IN cfDNA

For a Level 2 claim of cfDNA biomarkers with strong evidence of clinical significance, clinical validation needs to be from evidence presented with FDA-approved liquid biopsy companion diagnostic biomarkers for the specific tumor type at the biomarker or variant level. Such claims should also be supported by analytical performance for each biomarker from at least LoD, precision/reproducibility, and accuracy studies.

LEVEL 3A: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY STRONG ANALYTICAL VALIDATION USING CFDNA AND CONCORDANCE BETWEEN CFDNA AND TISSUE

Clinical evidence can be provided from tissue-based companion diagnostics. This should also be supported by analytical validation (LoD, precision, analytical accuracy, and concordance study to a tissue-based test) for the specific tumor type at the biomarker or variant level, using a representative approach for SNVs and indels. Evidence evaluating concordance between cfDNA- and tissue-samples for FDA-approved tissue markers should be demonstrated using an FDA-approved tissue test or a validated tissue test.

TUMOR TYPE
Breast invasive ductal carcinoma (IDC)

APPENDIX

About FoundationOne®Liquid CDx

ORDERED TEST #

LEVEL 3B: BIOMARKERS WITH EVIDENCE OF CLINICAL SIGNIFICANCE IN TISSUE SUPPORTED BY ANALYTICAL VALIDATION USING cfDNA

Clinical evidence can be provided from tissuebased companion diagnostics, with analytical validity supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).

LEVEL 4: OTHER BIOMARKERS WITH POTENTIAL CLINICAL SIGNIFICANCE

Biomarkers not categorized into Levels 1, 2, or 3 can be included under Level 4 for informational purposes or to be used to direct patients toward clinical trials for which they may be eligible. Such claims can be supported by clinical rationale for inclusion in the panel. Such rationale could also include peer-reviewed publications for genes/variants in tissue, variant information from well-curated public databases, or *in vitro* pre-clinical models. Analytical validation should be supported by a representative approach for SNVs and indels from key analytical studies (such as LoD, accuracy, and precision).
