Response to FDA Questions Re: GRAS Notice No. 903

CHEMISTRY QUESTIONS

Question 1

Naturex established limits for heavy metals (lead <3 mg/kg, arsenic <3 mg/kg, cadmium <1 mg/kg, and mercury <0.1 mg/kg) and pesticide residues in the raw materials. However, Naturex only provided a specification for lead (not more than 2 mg/kg) in their final products. Please establish specifications for arsenic, cadmium, mercury and pesticide residues in the final products, quillaia extract type 2 (QET2) liquid and powder, and provide results from five non-consecutive batches to demonstrate conformance with the provided specifications.

Response to Question 1

Specifications

Naturex has established final product specification limits for lead, mercury, cadmium, and arsenic in quillaia extract type 2 (QET2) (see Table C1-1 below). The limits for lead, arsenic, and mercury were established in accordance with the limits for these heavy metals in quillaia extract (E 999) in Commission Regulation (EU) No 231/2012 of 9 March 2012 laying down specifications for food additives (EU, 2012). The limit for cadmium was established in accordance with the limit in the raw material. No pesticide residues were detected in 5 lots of QET2 liquid and 5 lots of QET2 powder (see Table C1-2 and C1-3 below), which demonstrates that there is no selective concentration of pesticides in QET2 liquid or powder as a result of the manufacturing process. On the basis that pesticide residues in the quillaja wood and bark must conform to the limits established in Regulation (EC) No. 396/2005 (EC, 2005) and the United States Pharmacopeia (USP, 2018) and there is no selective concentration in the QET2, a specification limit for pesticide residues was not considered necessary.

Table C1-1 Heavy Metals and Pesticides Specifications for Quillaia Extract Type 2

Specification Parameter	Specification		Method
	Naturex (liquid products)	Naturex (powder products)	
Heavy Metals			
Lead (mg/kg)	≤2	≤2	AOAC 999.10
Mercury (mg/kg)	≤1	≤1	Norma Chilena (NCh) 2667
Cadmium (mg/kg)	≤1	≤1	AOAC 999.11
Arsenic (mg/kg)	≤2	≤2	AOAC 986.15
Pesticides			
Pesticides	NE	NE	QuEChERs by HPLC/MS/MS and GC/MS; IT-SGC-01

AOAC = Association of Official Analytical Chemists; GC-MS = gas chromatography-mass spectrometry; LC-MS = liquid chromatography-mass spectrometry; NE = not established.

Batch Analyses

Naturex has analyzed 5 lots of QET2 liquid and 5 lots of QET2 powder for heavy metals (*i.e.*, lead, mercury, cadmium, and arsenic) and pesticides. The results are summarized below in Tables C1-2 and C1-3, for liquid and powder products, respectively. The results demonstrate that the levels of lead, mercury, cadmium, and arsenic in QET2 liquid and powder are well below the established limits. The results of the pesticide analyses demonstrate that no pesticides were detected in QET2 liquid or powder. The results further demonstrate that there is no selective concentration of either heavy metals or pesticides in QET2 liquid or powder as a result of the manufacturing process. See Annex A for the Certificates of Analysis and the full list of pesticides analyzed.

Table C1-2 Summary of Batch Analysis Results for Heavy Metals and Pesticides for 5 Lots of Quillaia Extract Type 2 Liquid

Specification Parameter	Limit	Manufacturing Lot				
		Q344/001/D19	Q357/002/D19	Q107/001/D20	Q350/001/D19	Q240/003/D19

Pesticides						
Pesticides	ND	ND	ND	ND	ND	ND

ND = not detected.

Question 2

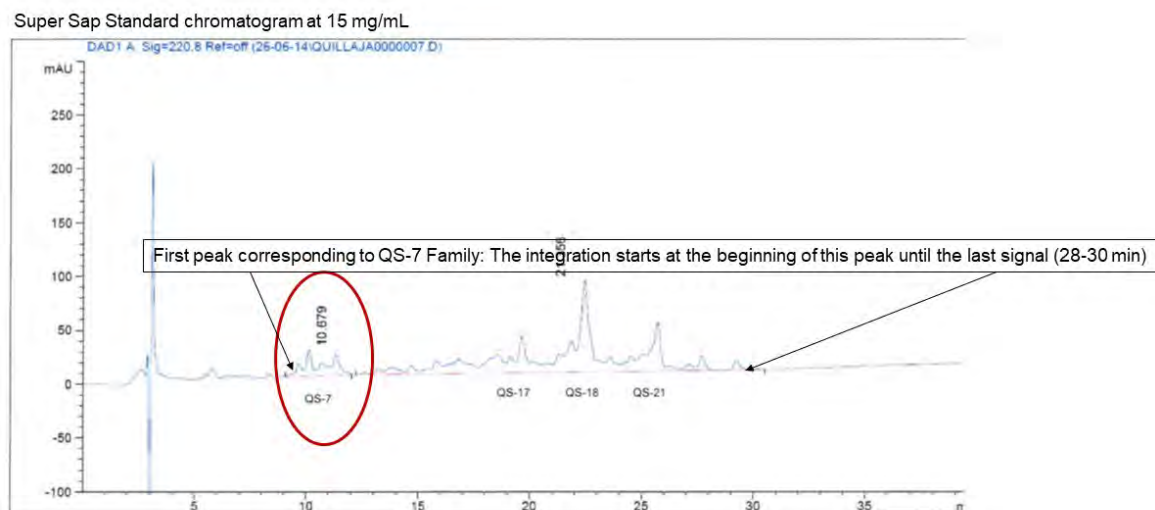

Naturex provided a representative chromatogram for the liquid QET2 product and stated that this is used to calculate the amount of saponins in the final product. Based on the chromatogram, it is not clear that the peaks on the chromatogram are resolved from each other so that the peak areas can be determined to yield quantitative results. Please describe the method for the quantitation of saponin content in the final products and provide a chromatogram demonstrating resolution of the saponin peaks in the final product.

Response to Question 2

The complete method of analysis for saponins in QET2 is provided in Annex B. Briefly, the saponins QS-7, QS-17, QS-18, and QS-21 are separated by reverse phase high-performance liquid chromatography (RP-HPLC) with external standard calibration. The concentration of saponins (C_{sap}) is calculated from the sums of the peak areas attributed to the principle saponins in the sample (A_{sample}) and standard preparation ($A_{standard}$) and the saponins concentration of the standard ($C_{standard}$) using the formula $C_{sap} = (A_{sample}/A_{standard})C_{standard}$. The method of analysis is based on the methods described by Joint FAO/WHO Expert Committee on Food Additives (JECFA) (2006a) and San Martin and Briones (2000).

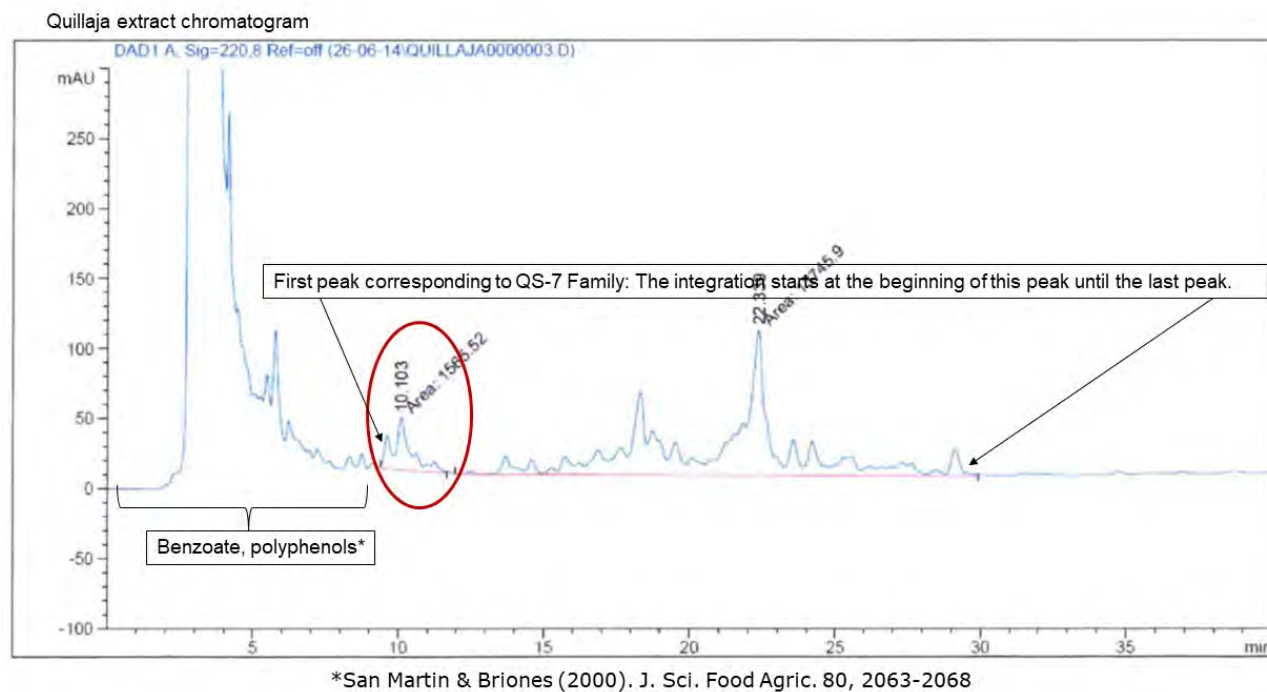

An example chromatogram of the standard that is used for quantification is provided in Figure C2-1 below.

Figure C2-1 Super Sap Standard Chromatogram

An example chromatogram of quillaia extract with the identification of the peaks for quantification is provided in Figure C2-2 below.

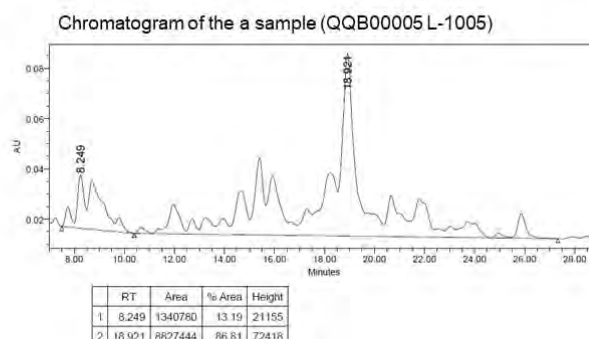

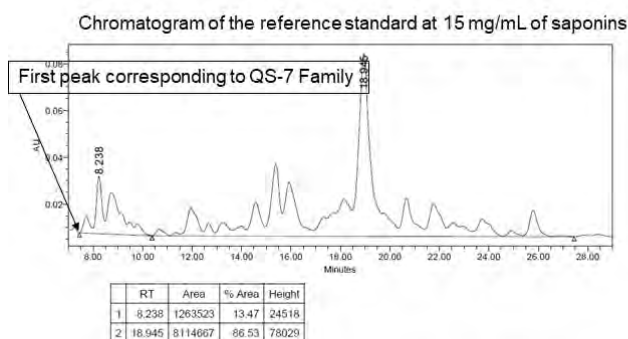

Figure C2-2 Quillaia Extract Chromatogram

An example of the calculations with the corresponding chromatograms is provided in Figure C2-3 below.

Figure C2-3 Example Calculation of Saponin Content in Quillaia Extract

Calculations example:

Calculation: $C_{sap} = (A_{sample}/A_{standard})C_{standard}$

$C_{saponins\ sample} = ((Area\ sample: 21155 + 72418 = 93573) / (A_{std}: 24518 + 78029 = 102545)) * (C_{std} = 15\ mg/mL) = 13.68\ mg/mL$

Weight of the sample: 1076 mg

$$\% \text{ Saponins} = 100 \times C_{sap} / (0.1W_{sample})$$

$\% \text{ Saponins} = (100 \times 13.68\ mg/mL) / (0.1 \times 1076\ mg) = 12.71\% \text{ as is.}$

To obtain the saponins over dry basis (ODB) content we must consider the total solid content of the sample weighted. In this case is 32.54%:

$12.71\% \times 100 / 32.54\% = 39.07\% \text{ Saponins ODB}$

These procedure is do it in triplicate, so the informed quantity is the average of three independent measurements.

Question 3

Please specify that all analytical methods are validated for their intended use. If standard methods are used, please provide the complete and appropriate citations.

Response to Question 3

All analytical methods used in the analysis of QET2 are validated for their intended use. The analytical methods and their citations are provided below in Table C3-1. In-house analytical methods and the accreditation certificates for the lab that conducted the heavy metals and pesticides analyses are provided in Annex B.

AOAC = Association of Official Analytical Chemists; cfu = colony-forming units; dwb = dry weight basis; GC-MS = gas chromatography-mass spectrometry; HPLC = high-performance liquid chromatography; I.R. = infrared; LC-MS = liquid chromatography-mass spectrometry.

^a Internal measure for calculation of parameters with limits on a dry weight basis.

Question 4

Naturex provided a table of physical, chemical, and microbial specifications (Table 2.3.1-1), a table of product control limits (Table 2.3.1-2), and batch analyses (Tables 2.3.2-1, 2.3.2-2, and 2.3.2-3) for some of these specifications in the powder and liquid products. It is not clear which parameters are specifications are for the products and which ones are control limits, not specifications. Please provide a table indicating the specifications for the products, as well as the batch analysis for these parameters demonstrating conformance with the stated specifications.

Response to Question 4

The final product specifications for Naturex's QET2 were provided in Table 2.3.1-1 in the Generally Recognized as Safe (GRAS) notice; however, this table also included reference to the table of control limit parameters. We apologize for any confusion this may have caused. The final product specifications (without control plan parameters) and updated to remove the total solids parameter and include limits for heavy metals and the correct unit of measure for microbiological parameters for liquid QET2 are provided below in Table C4-1.

Table C4-1 Physical, Chemical, and Microbiological Specifications for Quillaia Extract Type 2

Specification Parameter	Specification		Method
	Naturex (liquid products)	Naturex (powder products)	
Identity

^a Internal measure for calculation of parameters with limits on a dry weight basis.

The supporting analytical data in the GRAS notice were divided into tables for the specification parameters and a table for the control plan limits. The analytical results for the specification parameters were provided in the GRAS notice in Table 2.3.2-1 (liquid product) and Table 2.3.2-2 (powder product). These tables have been reproduced below for the sake of clarity (see Tables C4-2 and C4-3). The units of measure for the microbiological parameters have also been updated to the correct unit (cfu/mL), as per the request of Chemistry Question 7. Analytical data demonstrating compliance with the specification limits for heavy metals as requested by the United States (U.S.) Food and Drug Administration (FDA) are provided above in response to Chemistry Question 1 (see Tables C1-2 and C1-3).

Question 5

The specification for total solids is listed as not established. It is not clear how there can be a specification for a parameter without a numerical value in which to demonstrate conformance with that specification. Please discuss this discrepancy.

Response to Question 5

Total solid is a parameter linked to loss on drying analysis (LOD). An analysis for total solids is not performed directly but rather is a calculation from the LOD test results. The amount is obtained as follows $100\% - \text{LOD} = \text{total solids}$. Consequently, total solids should correspond to 10 to 50% for the liquid form and more than 94% for the powder form.

However, the total solids value is provided only for customer information, and there is no limit for the liquid and powder products. As the products do not need to meet a defined limit, and the calculation is for information only, we propose to remove this test from specification. Accordingly, total solids has been removed from the final product specifications provided in Table C4-1 above in response to Chemistry Question 4.

Question 6

The notice states that the method used to perform aerobic plate counts is NF EN ISO 4833 (page 14). We note that ISO 4833 has two parts, which respectively correspond to: Microbiology of the Food Chain – Horizontal Method for the Enumeration of Microorganisms – Part 1: Colony Count at 30 Degrees C by the Pour Plate Technique (ISO 4833-1:2013); Microbiology of the Food Chain – Horizontal Method for the Enumeration of Microorganisms – Part 2: Colony Count at 30 Degrees C by the Surface Plating Technique (ISO 4833-2:2013). Please clarify which method is used to perform the aerobic plate counts.

Response to Question 6

The method used is Part 1: Colony Count at 30 Degrees C by the Pour Plate Technique (ISO 4833-1: 2013).

Question 7

On pages 15 and 19, respectively, Table 2.3.2-1 and Table 2.4-1 list the microbiological specifications for the QET2 liquid product as CFU/g. We note that the appropriate units are CFU/mL. For the administrative record, please provide a statement that corrects these specifications.

Response to Question 7

The units of measure for the microbiological parameters for liquid QET2 were erroneously provided as cfu/g. We apologize for this error. The correct units for the microbiological parameters for liquid QET2 are cfu/mL. For the sake of clarity, the microbiological limits for QET2 have been reproduced in Table C7-1 below, with the correct unit of measure. The units of measure have also been corrected in the final product specifications provided above in response to Chemistry Question 4 (see Table C4-1).

Table C7-1 Microbiological Specifications for Quillaia Extract Type 2

Specification Parameter	Naturex (liquid products) Specification	Method
Microbiological Specifications		
Aerobic plate count (cfu/ mL)	<100	CQ-MO-231; NF EN ISO 4833
Yeast (cfu/ mL)	<10	CQ-MO-244; NF V 08-059
Mold (cfu/mL)	<10	CQ-MO-244; NF V 08-059

cfu = colony-forming units.

Question 8

In Table 2.3.1-1, the specification for saponins is listed as 65 to 75% for the liquid product and >65% for the powder product. The batch analysis indicates that the saponin content in six lots of the liquid product and one lot of the powder product are greater than 70% (Tables 2.3.2-1 and 2.3.2-2). We further note that Naturex stated that JECFA concluded that QET2 should have a specification for saponin content of 65-90%. Please confirm that the maximum level of saponins in the final products would be no greater than 75%. In addition, when Naturex estimated exposure to saponins from the proposed use, the minimum saponin content of 65% was used. We note that when the use-levels for the current uses for quillaia extract type 1 (QET1) were converted to a saponin basis (Table 3.1-1), the maximum saponin level was used. Therefore, it is not clear why the minimum specification for saponins was used to calculate the use-level on a saponin basis for QET2, as this would result in a less conservative exposure estimate from the proposed use of QET2. Please address this inconsistency in how the use-level on a saponin basis was estimated for QET1 and QET2. In addition, please provide the use-levels for saponins based on the maximum specification limit for saponins in QET2 and revise the exposure estimate for saponins accordingly. It would also be helpful if the NHANES food codes used in the exposure estimate were provided.

Response to Question 8

Maximum Level of Saponins in the Final Products

Naturex established the limit of 65 to 75% saponins [dry weight basis (dwb)] in QET2 liquid and >65% saponins (dwb) in QET2 powder based on the analytical data presented in Tables 2.3.2-1 and 2.3.2-2 of the GRAS notice; however, it is correct that these limits are not the same as those established by the JECFA for QET2 (JECFA, 2014). Therefore, Naturex has determined that the specification limits for saponins in the final products can be aligned with the JECFA specification limits of 65 to 90% saponins (dwb). Of note, as described in the following responses, this does not affect the exposure assessment of saponins that was conducted.

Use-Levels on a Saponin Basis

The U.S. FDA is correct that the approach taken for determining the use-levels of the 2 forms of quillaia extract [quillaia extract type 1 (QET1) and QET2] was different; however, it is not correct that the minimum specification for saponins was used to calculate the use-level on a saponin basis for QET2. This issue is clarified in the below discussions explaining the way that the use-levels were reported.

For QET1, use-levels were reported on the basis of the ingredient and converted to be expressed on the basis of saponins for the purpose of the exposure assessment. The use-levels were reported based on the conditions of use that were concluded to be GRAS by the Expert Panel of the Flavor and Extract Manufacturers Association of the United States (FEMA) in FEMA GRAS 27 (Cohen *et al.*, 2015) and by the American Beverage Association (ABA) and notified to the U.S. FDA and filed by the Agency as GRN 165 without objection (U.S. FDA, 2005). These levels were reported by FEMA and the ABA for the ingredient itself. Table 3.1-1 of the GRAS notice is replicated below and presented as Table C8-1. The third column "Quillaia Extract Use-Level, Ave./Max. (ppm)" presents the use-levels for quillaia extract (ingredient) as reported in FEMA GRAS 27 or GRN 165. These levels were converted to a saponin basis using the maximum content of saponins of 26% w/w for QET1 from the JECFA specification (JECFA, 2006a) for QET1 [i.e., final column "Quillaia Extract Use-Level, as Saponins, Ave./Max. (mg/100 g)"] for the purposes of conducting a combined exposure assessment to saponins with the proposed conditions of use

(i.e., current and proposed). The maximum specification limit for saponins in QET1 was used in this instance to provide a worst-case exposure to saponins from the use of QET1.

Table C8-1 Summary of the Current^a Food-Uses and Use-Levels for Quillaia Extract in the U.S.

Food Category (21 CFR §170.3) (U.S. FDA, 2019)	Current Food-Uses	Quillaia Extract Use-Level, Ave./Max. (ppm)^b	Quillaia Extract Use-Level, as Saponins, Ave./Max. (mg/100 g)^c
Baked Goods and Baking Mixes	Baked Goods	24/30	0.6/0.8
Beverages, Alcoholic	Alcoholic Beverages	90/100	2.3/2.6

Ave./Max. = average usual and maximum use-level for flavoring substance; CFR = Code of Federal Regulations; U.S. = United States.

^a Current uses incorporate the specific uses as included in FEMA GRAS 27 (Cohen *et al.*, 2015) (FEMA No. 2973) and GRN No. 000165 (U.S. FDA, 2005).

Table C8-1 Summary of the Current^a Food-Uses and Use-Levels for Quillaia Extract in the U.S.

Food Category (21 CFR §170.3) (U.S. FDA, 2019)	Current Food-Uses	Quillaia Extract Use-Level, Ave./Max. (ppm) ^b	Quillaia Extract Use-Level, as Saponins, Ave./Max. (mg/100 g) ^c
--	-------------------	--	---

^b Use-levels are transcribed as expressed in FEMA GRAS 27 (Cohen *et al.*, 2015) (FEMA No. 2973), which were assumed to be for quillaia extract type 1, and as in GRN No. 000165, which was for quillaia extract type 1, and on the basis of the total ingredient.

^c Use-levels for 'current uses' have been converted to a saponin basis, assuming a maximum saponin content of 26% w/w for quillaia extract type 1 on the basis of the upper limit in the specifications for quillaia extract type 1, established by the Joint FAO/WHO Expert Committee on Food Additives (JECFA, 2006a). These are the values used in the intake assessment described in Part 3.2.2 of the GRAS notice. Average usual use-level for flavoring use have been used in the assessment.

^d Different use-levels for 'beverages and beverage bases' included in GRN No. 000165 (Semi-Frozen Carbonated and Non-Carbonated Beverages and Brewed Sodas) and FEMA GRAS 27 (Other Beverages).

^e Only brewed sodas were included, as identified in GRN No. 000165.

For QET2, use-levels were reported on the basis of saponins and converted to be expressed on the basis of the ingredient to conduct a secondary assessment of worst-case exposure to the ingredient. The maximum use-levels were provided by Naturex as saponins; this is the active component of the quillaia extract, and as such, the use-level of saponins is used by manufacturers to achieve the appropriate emulsification properties. Table 1.3-1 of the GRAS notice is replicated below and presented as Table C8-2. The third column "Quillaia Extract Type 2 Use-Level, as saponins (mg/100 g)" presents the use-levels as provided by Naturex. These levels were converted to the equivalent amount of the ingredient based on the minimum content of saponins of 65% w/w for QET2 (ingredient) for the purposes of conducting a secondary exposure assessment for the ingredient itself (*i.e.*, an assessment of the intakes of the whole ingredient QET2 based on the proposed uses for the ingredient); the lowest specification limit was selected, as it allows the determination of the highest amount of the ingredient.

Table C8-2 Summary of the Proposed Food-Uses and Use-Levels for Quillaia Extract Type 2 in the U.S.

Food Category (21 CFR §170.3)	Proposed Food-Uses	Quillaia Extract Type 2 Use-Level, as Saponins (mg/100 g) ^a	Quillaia Extract Type 2 Use-Level (mg/100 g) ^b
Beverages, Alcoholic	Cocktail Drinks ^c	19.5	30
	Distilled Liquors ^c	19.5	30
Beverages and Beverage Bases	Energy Drinks ^c	19.5	30
Chewing Gum	Chewing Gum	39.0	60
Coffee and Tea	Specialty Coffee Drinks (Lattes, Cappuccinos, Mochas) ^c	19.5	30
Condiments and Relishes	Mustard	120	184.6
Confections and Frostings	Frostings, Icings	120	184.6
	Coatings	120	184.6
Dairy Product Analogs	Coffee Whiteners ^c	19.5	30
	Non-Dairy Milk and Cream	45	69
Fats and Oils	Fat-Based Sauces	90	138.5
	Mayonnaise and Mayonnaise-Type Dressings	120	184.6
	Salad Dressings	90	138.5
Frozen Dairy Desserts	Ice Cream *	26	40
	Other Frozen Milk Desserts	65	100

Table C8-2 Summary of the Proposed Food-Uses and Use-Levels for Quillaia Extract Type 2 in the U.S.

Food Category (21 CFR §170.3)	Proposed Food-Uses	Quillaia Extract Type 2 Use-Level, as Saponins (mg/100 g) ^a	Quillaia Extract Type 2 Use-Level (mg/100 g) ^b
Fruit and Water Ices	Edible Ices, Sherbet, and Sorbet	60	92.3
Hard Candy	Hard Candy	39	60
Jams and Jellies	Jams, Jellies, Preserves, and Marmalades ^c	19.5	30
Soft Candy	Nougat and Toffees	20	30.8
	Gummies	20	30.8

Dietary Supplements	Solid dietary supplements	600; 3 mg/500 mg serving ^d	923; 4.6 mg/500 mg serving
	Liquid dietary supplements	600; 30 mg/5 g serving ^d (~1 tsp)	923; 46 mg/5 g serving
	Botanical supplements, powdered	1,300; 6.5 mg/500 mg serving ^d	2,000; 10 mg/500 mg serving

CFR = Code of Federal Regulations; tsp = teaspoon; U.S. = United States.

^a Use-levels 'as saponins' (reference component) were used in the intake assessment described in Part 3.2.2 of the GRAS notice, considering both current and proposed use-levels. When there was overlap in the 'current' (as Table 3.1-1) and 'proposed' uses, the proposed use-levels were utilized. In cases where a single food-use within a food category was proposed at a higher use-level than current uses, the proposed use-level was used for the identified food-use and the current use-level was used for all remaining food-uses within the food category.

^b Use-levels converted from a saponin basis (reference component) to the ingredient itself using a minimum specification of 65%. These values were used in the intake assessment described in Part 3.2.3 of the GRAS notice, considering proposed use-levels only.

^c Use of quillaia extract is present at specified use-level in final food through carry-over, including food flavors, colors, cloudy agent, or other ingredients.

^d Values for an average serving were based on typical products in which quillaia extract are proposed for use.

* Quillaia is intended for use in unstandardized products when standards of identity do not permit its addition.

In summary, there were different conversions required for each form of quillaia extract to allow:

1. An exposure assessment to saponins resulting from the combined use of both current (QET1) and proposed (QET2) uses. This involved conversion of QET1 to a saponin basis using the maximum content of saponins for this form (26 % w/w) and the use of the maximum saponin use-levels provided by Naturex for QET2.
2. An exposure assessment for QET2 – expressed on the ingredient basis – that was conducted for proposed uses only. This involved conversion of QET2 to an ingredient basis using the minimum content of saponins for this form (65% w/w) to allow maximum exposure to the ingredient itself.

Maximum Use-Levels for Saponins

The use-levels presented in Table C8-2 above, and replicated from Table 1.3-1 of the GRAS notice, are expressed on the saponin basis and are the maximum use-levels for saponins, as provided by Naturex. Saponins are the active component of the QET2 ingredient, and thus the use-levels are reported on this basis.

Food Codes

Please see Annex C for the list of food codes used in the original exposure assessment, which incorporates current uses of QET1 and proposed uses of QET2.

Question 9

Naturex did not define the age range for the “all-ages” population. It is not clear if this population reflects those aged 0 years and older, or if the “all-ages” population represents our typical age range of 2 years and older. Please state the ages represented by the “all-ages” exposure estimate. If this estimate does not represent the US population aged 2 years and older, please provide an exposure estimate for this population.

Response to Question 9

The estimated daily intake for the ‘all ages’ population in the GRAS notice included individuals under 2 years. As such, the results have been updated below to provide the total population as the typical age range of 2 years and older (updated figures are **bolded**).

Tables C9-1 and C9-2 present the results for intakes of saponins resulting from current and proposed (*i.e.*, QET1 and QET2) uses of quillaia extract (corresponding to Table 3.2.2-1 and Table 3.2.2-2 of the GRAS notice). The estimated mean and 90th percentile daily intakes for the total population (2 years and older) among consumers only are 31 and 76 mg/day, respectively, on an absolute basis and 0.5 and 1.0 mg/kg body weight/day, respectively, on a body weight basis. There are no changes to the highest estimated results, whereby male adults had the highest daily intakes on an absolute basis, of 38 and 91 mg/day at the mean and 90th percentile, respectively. On a body weight basis, infants and young children were identified as having the highest mean intakes of 0.8 mg/kg body weight/day, while children were identified as having the highest 90th percentile consumer-only intakes, at 1.5 mg/kg body weight/day.

Table C9-1 Summary of the Estimated Daily Intake of Saponins from Quillaia Extract Based on Current and Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Infants and Young Children	0 to <3	8	12	78.2	491	10	17
Children	3 to 11	17	40	100	1,284	17	40
Female Teenagers	12 to 19	22	62	100	577	22	62
Male Teenagers	12 to 19	20	55	100	559	20	55
Female Adults	20 and up	32	73	100	2,387	32	73
Male Adults	20 and up	38	91	100	2,089	38	91
Total Population	2 and up	31	76	100	7,063	31	76

n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

Table C9-2 Summary of the Estimated Daily Per Kilogram Body Weight Intake of Saponins from Quillaia Extract from Current and Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Infants and Young Children	0 to <3	0.7	0.9	78.1	489	0.8	1.2
Children	3 to 11	0.6	1.5	100	1,275	0.6	1.5
Female Teenagers	12 to 19	0.3	0.9	100	568	0.3	0.9

Female Adults	20 and up	0.4	1.0	100	2,373	0.4	1.0
Male Adults	20 and up	0.4	1.0	100	2,080	0.4	1.0
Total Population	2 and up	0.5	1.0	100	7,019	0.5	1.0

bw = body weight; n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

Question 10

Naturex states that the exposure is estimated for saponins from the proposed use of QET2. However, the title for Table 3.2.3-1 states that the table depicts the exposure for QET2 from the proposed uses. Please clarify that this table represents the exposure to saponins from the proposed use of QET2. In addition, there are inconsistencies in the text regarding the exposure estimate. For example, text in Section 3.2.3 discusses exposure to QET2 when it is referring to the exposure to saponins from the proposed use of QET2. Please correct these inconsistencies in the text to accurately reflect the exposure estimate being discussed.

Response to Question 10

Exposure estimates to saponins from the combined current uses of QET1 and proposed uses of QET2 were presented in Part 3.2.2 of the GRAS notice. In Part 3.2.3, exposure to QET2 (i.e., the ingredient itself) from the proposed uses was assessed, i.e., the exposure estimates in Part 3.2.3 were for the ingredient and not the intake of the saponins. Thus, the text and tables in Part 3.2.3 of the GRAS notice correctly identified intakes of QET2 as the ingredient. This was presented as a secondary assessment to consider exposure to the ingredient itself. The assessment of saponin intakes (presented in Part 3.2.2 of the GRAS notice) is considered the key intake assessment as it considers both forms and is expressed on the basis of the component considered responsible for any toxic effects.

For the purposes of completeness, and to avoid ambiguity, an updated exposure assessment has been conducted herein for the intake of saponins from the proposed uses of QET2 only (i.e., excluding current uses of QET1 under FEMA GRAS 27 and GRN 165). As described above in response to Chemistry Question 8, the use-levels for QET2 are expressed on the saponin basis (i.e., the active component). As such, this exposure assessment incorporates the values in Table C10-1 below (replicated from Table 1.3-1 of the GRAS notice, but omitting the conversion to the ingredient itself).

Table C10-1 Summary of the Proposed Food-Uses and Use-Levels for Quillaia Extract, Type 2, on a Saponin Basis in the U.S.

Food Category (21 CFR §170.3)	Proposed Food-Uses	Quillaia Extract Use-Level, Type 2, as Saponins, (mg/100 g)^a
Beverages, Alcoholic	Cocktail Drinks ^c	19.5
	Distilled Liquors ^c	19.5
Beverages and Beverage Bases	Energy Drinks ^c	19.5
Chewing Gum	Chewing Gum	39.0
Coffee and Tea	Specialty Coffee Drinks (Lattes, Cappuccinos, Mochas) ^c	19.5
Condiments and Relishes	Mustard	120
Confections and Frostings	Frostings, Icings	120
	Coatings	120
Dairy Product Analogs	Coffee Whiteners ^c	19.5
	Non-Dairy Milk and Cream	45
Fats and Oils	Fat-Based Sauces	90
	Mayonnaise and Mayonnaise-Type Dressings	120
	Salad Dressings	90
Frozen Dairy Desserts	Ice Cream *	26
	Other Frozen Milk Desserts	65
Fruit and Water Ices	Edible Ices, Sherbet, and Sorbet	60
Hard Candy	Hard Candy	39
Jams and Jellies	Jams, Jellies, Preserves, and Marmalades ^c	19.5
Soft Candy	Nougat and Toffees	20
	Gummies	20
	Soft Candy	20
Dietary Supplements	Solid dietary supplements	600; 3 mg/500 mg serving ^d
	Liquid dietary supplements	600; 30 mg/5 g serving ^d (~1 tsp)
	Botanical supplements, powdered	1,300; 6.5 mg/500 mg serving ^d

CFR = Code of Federal Regulations; tsp = teaspoon; U.S. = United States.

^a Use-levels 'as saponins' (reference component) were used in the first intake assessment (see Part 3.2.2 of the GRAS notice), considering both current and proposed use-levels. When there was overlap in the 'current' (as Table 3.1-1 of the GRAS notice) and 'proposed' uses, the proposed use-levels were utilized. In cases where a single food-use within a food category was proposed at a higher use-level than current uses, the proposed use-level was used for the identified food-use and the current use-level was used for all remaining food-uses within the food category.

[...]

^c Use of quillaia extract is present at specified use-level in final food through carry-over, including food flavors, colors, cloudy agent, actives delivery.

^d Values for an average serving were based on typical products in which quillaia extract are proposed for use.

* Quillaia is intended for use in unstandardized products when standards of identity do not permit its addition.

The methodology utilized for the current assessment is identical to that described in Part 3.2.1 of the GRAS notice, whereby food consumption data was obtained from National Health and Nutrition Examination Survey (NHANES) 2013-14. The use-levels are as described in Table C10-1 above. The food codes utilized in the assessment are those presented in Part 2 of Annex C to this response document.

Summaries of the estimated daily intake of saponins from the proposed uses of QET2 only are provided in Table C10-2 on an absolute basis (mg/person/day) and in Table C10-3 on a body weight basis (mg/kg body weight/day).

There was a high percent of consumers of products in which QET2 is proposed for use, whereby 75.9% or greater of NHANES subjects above 3 years, and 54.3% of individuals up to 3 years, were identified as consumers (Table C10-2). The consumer-only estimates are discussed in detail herein.

Among the total population (2 years and over), the mean and 90th percentile consumer-only intakes of saponins from the proposed uses of QET2 were determined to be 29 and 71 mg/person/day, respectively. Of the individual population groups, male adults were determined to have the greatest mean and 90th percentile consumer-only intakes of saponins on an absolute basis, at 34 and 82 mg/person/day, respectively, while infants and young children had the lowest mean and 90th percentile consumer-only intakes of 14 and 21 mg/person/day, respectively (Table C10-2).

Table C10-2 Summary of the Estimated Daily Intake of Saponins from Quillaia Extract Type 2 Based on Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Infants and Young Children	0 to <3	7	12	54.3	320	14	21
Children	3 to 11	15	37	89.5	1,098	17	38
Female Teenagers	12 to 19	20	58	81.8	463	24	67
Male Teenagers	12 to 19	18	48	75.9	434	23	53
Female Adults	20 and up	28	69	94.1	2,199	30	71
Male Adults	20 and up	31	78	91.1	1,869	34	82
Total Population	2 and up	27	67	90.7	6,211	29	71

n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

On a body weight basis, the total population (2 and up) mean and 90th percentile consumer-only intakes of saponins from QET2 were determined to be 0.4 and 1.0 mg/kg body weight/day, respectively. Among the individual population groups, infants and young children were identified as having the highest mean consumer-only intakes of 1.1, while infants and young children and children had the highest 90th percentile consumer-only intakes of 1.6 mg/kg body weight/day. Male teenagers had the lowest mean and 90th percentile consumer-only intakes of 0.3 and 0.8 mg/kg body weight/day, respectively (Table C10-3).

Table C10-3 Summary of the Estimated Daily Per Kilogram Body Weight Intake of Saponins from Quillaia Extract Type 2 from Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Infants and Young Children	0 to <3	0.6	0.9	54.0	318	1.1	1.6
Children	3 to 11	0.5	1.5	89.6	1,092	0.6	1.6
Female Teenagers	12 to 19	0.3	0.9	81.7	455	0.4	0.9
Male Teenagers	12 to 19	0.2	0.7	75.8	432	0.3	0.8
Female Adults	20 and up	0.4	0.9	94.1	2,187	0.4	1.0

Table C10-3 Summary of the Estimated Daily Per Kilogram Body Weight Intake of Saponins from Quillaia Extract Type 2 from Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Male Adults	20 and up	0.4	0.9	91.1	1,861	0.4	0.9
Total Population	2 and up	0.4	1.0	90.7	6,174	0.4	1.0

bw = body weight; n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

Question 11

Saponins can be consumed as part of the normal diet. Please discuss the background exposure to saponins from the diet and compare the exposure from the proposed uses to that from the background exposure for saponins.

Response to Question 11

In order to identify scientific literature relevant to the background dietary exposure to saponins, a comprehensive search of the scientific literature was conducted in August 2020 using the electronic search tool ProQuest Dialog™. The following databases were searched: AdisInsight: Trials, AGRICOLA, AGRIS, Allied & Complementary Medicine™, BIOSIS® Toxicology, BIOSIS Previews®, CAB ABSTRACTS, Embase®, Foodline®: SCIENCE, FSTA®, MEDLINE®, NTIS: National Technical Information Service, and ToxFile®. The terms ‘saponin or saponins’ were searched in combination with terms relevant to exposure and intakes (*i.e.*, “daily intake*” or consumption or diet or dietary or consume or consumed) and terms to identify intakes by humans (*i.e.*, human or man or woman or male or female or population). Exclusions for common laboratory species were applied in an effort to limit the results to studies reporting on human intakes. The search results were retrieved and reviewed in 2 stages (titles and abstracts).

Limited quantitative data were identified on background exposure to saponins in the diet. Ridout *et al.* (1988) reported on the mean daily intakes of saponins from legumes in the United Kingdom (UK) population in 1983 as well as specific subgroups expected to have higher intakes of legumes, such as vegetarians. The results of the study indicated mean saponin intake to be 14.6 mg/day in the total population and up to 213 mg/day in the subgroups. However, the study by Ridout *et al.* (1988) only considered saponin intakes from legumes whereas, saponins are present in a broad range plant species consumed in the diet (Fenwick and Oakenfull, 1983; see Table C11-1 below). The mean background exposure to saponins from legumes of 14.6 mg/day is approximately half the mean exposure to quillaia saponins resulting from the current uses of QET1 and proposed uses of QET2 (*i.e.*, 31 mg/person/day; see Table C9-1 above), while the mean intake of 213 mg/day in male Asian vegetarians was almost 3-fold higher than the 90th percentile total population intakes of quillaia saponins from the current uses of QET1 and proposed uses of QET2 (*i.e.*, 76 mg/person/day; see Table C9-1 above). However, as discussed below, due to the varying properties of individual saponins, it is not possible to assess the safety of quillaia saponins based on the intakes of other saponins.

Table C11-1 Saponin Content of Edible Plants and Some Prepared foods (Adapted from Fenwick and Oakenfull, 1983)

Plant or Prepared food	Samples Analyzed by Author		Comparison with Previous Estimates in Literature
	Saponins, food as consumed (g/kg)	Saponins, dry basis (g/kg)	Saponins, dry basis (g/kg)

NA = not applicable; ND = not determined; USA = United States of America.

Additional complications when assessing total dietary intakes of saponins include, the varying saponin content within plant species depending on the cultivar and growing conditions, and the diverse group of glycosides that are classified as saponins, which makes estimating overall background exposure to total saponins, especially with accuracy, quite difficult (Fenwick and Oakenfull, 1983; Price *et al.*, 1987; Milgate and Roberts, 1995). Furthermore, the biological properties of each individual saponin vary substantially (Oakenfull *et al.*, 1979; Price *et al.*, 1987; Milgate and Roberts, 1995). For example, the glycoalkaloid solanine, which can be found in potatoes, tomatoes, and other edible nightshade species, is classified as a saponin and is considered to be quite toxic. Conversely, most saponins derived from edible plant species (see Table C11-1 above) present a low risk of toxicity *via* the oral route, and many are reported to have varying potential for beneficial effects such as lowering cholesterol levels (Price *et al.*, 1987). In the case of quillaia saponins specifically, the 2004 Chemical and Technical Assessment of quillaia extracts prepared by the Food and Agriculture Organization indicated that “*Quillaia saponins are structurally different from the saponins derived from other plant species*” (FAO, 2004). Therefore, comparison of overall background intakes of total saponins to consumption of quillaia saponins would not be biologically or toxicologically relevant due to the significant variation in biological properties of individual saponins (Oakenfull *et al.*, 1979; Price *et al.*, 1987; Milgate and Roberts, 1995).

Due to varying biological and toxicological profiles, the most appropriate comparison would be background exposure to saponins from the current use of QET1 compared to the exposure to saponins from the proposed uses of QET2. Therefore, the results for the revised exposure estimates of saponins based on the maximum use-levels for QET2 on a saponin basis from its proposed use, previously presented in Table C10-3, and the results for the exposure estimate for saponins from the combined consumption from the proposed uses of QET2 and current uses of QET1, previously presented in Table C9-2, were used to calculate the background exposure to saponins resulting from the current uses of QET1 only by difference, to obtain an estimate of potential background intakes to this substance. The results are presented in Table C11-2 below. Intakes are examined on a *per capita* basis (as opposed to a ‘consumer only’ basis) as it cannot be assumed (and is unlikely) that individuals who consume saponins from QET2 will be the same as individuals who consume saponins from QET1, and as such, it would not be a suitable comparison. The calculated background contribution of saponin intakes from QET1 only, as a proportion of total saponin intakes from the combined consumption of QET2 and QET1, was low among all age groups evaluated. On a total population basis (2 years and up), the mean and 90th percentile intakes of saponins from the current uses of QET1 were 0.06 and 0.09 mg/kg body weight/day, respectively (final column). In comparison, the total population intakes of saponins from the proposed uses of QET2 were 0.39 and 0.95 mg/kg body weight/day, resulting in mean and 90th percentile total intakes of saponins from both current and proposed uses of 0.46 and 1.04 mg/kg body weight/day. Thus, exposure to quillaia saponins will be substantially higher from the proposed uses of QET2 than from the current uses of QET1, which can be expected, as the maximum use-levels on a saponin basis for QET2 are substantially greater than those of QET1 (see Tables C8-1 and C8-2). Nonetheless, the safety of QET2 is not based on historical consumption of saponins from quillaia extract in the diet, but rather, it is based on an adequate margin of exposure between the highest estimated intakes of saponins from both current and proposed uses compared to the most appropriate no-observed-adverse-effect level (NOAEL) from the pivotal toxicology study. Specifically, the most appropriate NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from Drake *et al.* (1982) provides a 200-fold margin of exposure when compared to the highest 90th percentile consumer-only intakes of 1.5 mg saponins/kg body weight/day (children aged 3 to 11 years; see Table C11-2 below) resulting from the combined current uses of QET1 and the proposed uses of QET2. Therefore, the estimated intakes of saponins resulting from the current uses of QET1 and the proposed uses of QET2 do not present a safety concern.

Table C11-2 Comparison of the Estimated Daily Per Kilogram Body Weight Intake of Saponins from Current Food-Uses of Quillaia Extract Type 1 in Comparison to the Intake of Saponins from the Proposed Food-Uses of Quillaia Extract Type 2 and from the Combined Current and Proposed Food-Uses in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Per Capita Intake of Saponins from QET2 (mg/kg bw/day)		Per Capita Intake of Saponins from Combined QET1+QET2 (mg/kg bw/day)		Per Capita Intake of Saponins from QET1 (mg/kg bw/day) ^a	
		Mean	90 th Percentile	Mean	90 th Percentile	Mean	90 th Percentile

TOXICOLOGY QUESTIONS

Question 1

Please provide the details of the literature search conducted in the preparation of the submitted GRAS notice. The details should include information on the date(s) of the search, the literature search period covered (from month/year to month/year), and the search terms and the database(s) used.

Response to Question 1

The submitted GRAS notice was not the first dossier that Naturex has prepared for QET2. Naturex was part of a group of 'interested parties' that submitted data for quillaia extracts in response to the European Food Safety Authority's (EFSA) call for data for the re-evaluation of the safety of quillaia extracts (E 999) as a food additive for use as an emulsifier and in flavorings. The group of interested parties submitted a dossier of technical and toxicological data. The toxicological data (all publicly available) was primarily compiled by another of the interested parties, with all interested parties providing data in response to follow-up calls for data and requests for clarification by EFSA. In response to a question from EFSA, a literature search for data specifically relevant to the metabolism of quillaia extracts was conducted in January 2016. The literature search was limited to studies published after 1994 as the Committee for Veterinary Medicinal Products had published a review in 1995 that included an assessment of metabolism of quillaia (EMA, 1995). The details of the metabolism literature search are provided below in Table T1-1.

The literature included in the GRAS notice for QET2 was obtained from the dossier prepared by the quillaia 'interested parties' in response to the EFSA call for data, as well as reviews conducted by regulatory and authoritative bodies. An updated literature search was also conducted in November 2019 to determine if there were any newly published studies relevant to the safety of QET2. The details of this update literature search are provided below in Table T1-1. No new literature relevant to the safety assessment of QET2 was identified in the updated literature search.

Question 2

To assess the safety of saponins, which are the toxic agents of concern from consumption of quillaia extracts, the exposure to saponins from the use of quillaia extracts in food are compared to a toxicological reference dose (e.g., ADI) for saponin. As noted above, in Table 3.1-1 (pp. 19-20), you summarize the current food-uses in the US and the associated use-levels of quillaia extract in these foods, which was assumed to be in the form of QET1. In converting the QET1 use-levels to a level of exposure to saponin, you assumed the upper level (26%) of an established range of 20-26% (dried basis) for saponin content of QET1 (JECFA, 2006). In Part 3.2.1 on pp 21-23, you described the basis of your determination of proposed saponin exposure (i.e., estimated daily intake) from intake of foods containing a Naturex QET2 product (see also Table 1.3-1). However, in this case

in converting the QET2 use-levels to a level of exposure to saponins, you assumed the lower specification limit (65%) of saponins in Naturex QET2 products instead of maximum saponin content (~75%, both the upper limit of the Naturex QET2 saponin specification for liquid Naturex QET2 (pp 12) and of the batch analysis for liquid and powder QET2 combined (pp 13-14)). Typically, in addressing the safety for a toxic substance, the most conservative estimates of exposure to a toxic substance are determined as was done for QET1, but not for QET2. Please address the following:

- a. Please explain your reasoning for using the exposure estimates for saponins derived by assuming the minimum level of saponin in QET2 to conduct your safety assessment which involved comparing the resulting saponin exposure estimates to derived saponin toxicological ADI (or Margin of Exposure, MOE) reference values. Please include a brief discussion of the appropriateness of your approach in performing a safety assessment.
- b. Please identify and state the values for the highest exposure group(s) for the following: (1) the revised exposure estimate for saponins at the 90th percentile based on the maximum level of saponins in QET2 from the proposed uses of QET2, and (2) the revised exposure estimate for saponins at the 90th percentile from the combined consumption of the proposed uses of QET2 and the current uses of QET1 in food, and compare each of these values separately to relevant ADI(s) (or MOE vs. NOAEL) values. Also, please briefly explain the meaning of these comparisons in terms of the safety of exposure to saponins.
- c. In Part 6.4.2.2 titled Chronic Toxicity on pp 40, you compared the NOAEL for saponin from your selected pivotal study to the exposure group with highest 90th percentile intake of saponin (i.e., 3- to 11-year olds) from the combined current and proposed uses of QET1 and QET2, respectively. You stated that “the estimated intakes of saponins are conservative in nature” and that “the safety of the estimated intakes of saponins” from these two types of extract use is “supported.” Please address, and clarify or correct, this concluding safety assessment statement about your “conservative saponin exposure estimate” considering the issues discussed above about the estimated exposure to quillaia extracts in your GRAS notice.

Response to Question 2a

Use-Levels on a Saponin Basis

As described in the response to Chemistry Question 8 above, the use-levels for the proposed uses of QET2 were reported by Naturex on the basis of the saponin content (i.e., they were not converted from the ingredient QET2). As saponins are the active component of the ingredient, and the component to which toxicity has been ascribed, the primary intake assessment was conducted on a saponin basis (see Part 3.2.2 in the GRAS notice). As Naturex provided maximum use-levels for QET2 on a saponin basis, these use-levels were used (without any conversion) in combination with use-levels on a saponin basis for QET1 (which required conversion from the QET1 ingredient itself using the maximum specification limit for saponins in QET1) in the primary intake assessment to achieve a worst-case exposure to saponins based on the current uses of QET1 and proposed conditions of use of QET2.

Response to Question 2b

Highest 90th Percentile

The results for the revised exposure estimate for saponins at the 90th percentile based on the maximum level of saponins in QET2 from proposed uses of QET2 are presented in the response to Chemistry Question 10 above, and the results on a body weight basis are replicated in Table T2-1 below. Among the individual population groups, infants and young children and children were identified as having the highest 90th percentile intakes of 1.6 mg/kg body weight/day.

The results for the exposure estimate for saponins at the 90th percentile from the combined consumption of saponins from the proposed uses of QET2 and current uses of QET1 are those that were presented in Part 3.2.2 of the GRAS notice, as the intakes were determined using the highest proposed use-levels for QET2 on a saponin basis and thus did not need to be revised. The results on a body weight basis are replicated in Table T2-1 below. Among the individual population groups, children were identified as having the highest 90th percentile consumer-only intakes, at 1.5 mg/kg body weight/day.

Table T2-1 Summary of the Estimated Daily Per Kilogram Body Weight Intake of Saponins from Current Food-Uses of Quillaia Extract Type 1 and Proposed Food-Uses of Quillaia Extract Type 2 in the U.S. by Population Group (2013-2014 NHANES Data)

Population Group	Age Group (Years)	Consumer-Only Intake of Saponins from QET2 (mg/kg bw/day)				Consumer-Only Intake of Saponins from Quillaia Extract (Combined QET1+QET2) (mg/kg bw/day)			
		%	n	Mean	90 th Percentile	%	n	Mean	90 th Percentile
Infants and Young Children	0 to <3	54.0	318	1.1	1.6	78.1	489	0.8	1.2
Children	3 to 11	89.6	1,092	0.6	1.6	100	1,275	0.6	1.5
Female Teenagers	12 to 19	81.7	455	0.4	0.9	100	568	0.3	0.9
Male Teenagers	12 to 19	75.8	432	0.3	0.8	100	557	0.3	0.8
Female Adults	20 and up	94.1	2,187	0.4	1.0	100	2,373	0.4	1.0
Male Adults	20 and up	91.1	1,861	0.4	0.9	100	2,080	0.4	1.0
Total Population	2 and up	90.7	6,174	0.4	1.0	100	7,019	0.5	1.0

bw = body weight; n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

These results demonstrate that when the QET1 uses (current uses under FEMA GRAS 27 and GRN 165) were removed, the intakes increased slightly in the infant and young children age group – from 0.8 and 1.2 mg/kg body weight/day to 1.1 and 1.6 mg/kg body weight/day (mean and 90th percentile). Similarly, the 90th percentile intake in the children aged 3 to 11 population group increased marginally from 1.5 to 1.6 mg/kg body weight/day and the mean intake in female teenagers increased marginally from 0.3 to 0.4 mg/kg body weight/day (no change at the 90th percentile). These increases are associated with the smaller consuming groups (which reduced from 78.1% to 54.3% consumers in the infants and young children population group, from 100% to 89.6% in the children aged 3 to 11 population group, and from 100 to 81.7% in the female teenagers population group) and the higher use-levels of the QET2 uses (19.5 to 120 mg saponins/100 g; Table C8-2 above) *versus* the levels used for flavoring and foaming purposes (<0.1 to 13.0 mg saponins/100 g; Table C8-1 above). No other increases in exposure values were identified amongst the population groups when expressed on a body weight basis.

Comparison with NOAEL

The most appropriate NOAEL on which to base the safety of the intake of QET2 is 3.0% *Q. saponaria* extract in the diet (*i.e.*, approximately 1,500 mg *Q. saponaria* extract/kg body weight/day, providing 300 mg *Q. saponaria* saponins/kg body weight/day) that was determined by the authors in the pivotal 2-year rat study (Drake *et al.*, 1982). The study by Drake *et al.* (1982) was considered the pivotal study in the safety assessment of QET2 as it was considered the most comprehensive as it was the longest duration and included a full toxicological evaluation (*e.g.*, body weight, feed intake, water intake, hematology, serum biochemistry, organ weights, gross and histopathology, urinalysis, tumor incidence). Furthermore, the NOAEL was determined by the study authors.

The most appropriate NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from Drake *et al.* (1982) provides a 187.5-fold margin of exposure in comparison to the highest 90th percentile consumer-only intakes of 1.6 mg saponins/kg body weight/day that occurred in infants and young children (aged 0 to <3) and children aged 3 to 11 years resulting from the proposed uses of QET2 (see Table T2-1).

The most appropriate NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from Drake *et al.* (1982) provides a 200-fold margin of exposure in comparison to the highest 90th percentile consumer-only intakes of 1.5 mg saponins/kg body weight/day that occurred in children aged 3 to 11 years resulting from the current uses of QET1 and the proposed uses of QET2 (see Table T2-1). This comparison is considered the most appropriate as the consumption estimates take into account all sources of quillaia saponins in the diet from the current uses of QET1 and the proposed uses of QET2.

Response to Question 2c

Conservative Nature of Estimates

As discussed above in response to Chemistry Question 8 and Toxicology Question 2.2a, the use-levels for the proposed uses of QET2 were reported by Naturex on the basis of the saponin content (*i.e.*, they were not converted from the ingredient QET2) and they were reported as the maximum use-level. The intake scenario that was presented in Part 3.2.2 of the GRAS notice utilized the highest use-levels of saponins from both the current uses of QET1 and the proposed uses of QET2. As such, the intake estimates that were derived using the highest saponin use-levels for both ingredients that are already in, or proposed to be in, the diet are the most relevant for the safety assessment of QET2. Furthermore, the following conservative assumptions were taken into account to ensure the resulting exposure estimates were representative of the worst-case values:

- The maximum proposed use-levels of QET2, as saponins, was incorporated into the exposure assessments;
- All uses included in FEMA GRAS 27 and previously concluded to be GRAS by the ABA (GRN 165) were incorporated into the cumulative model, based on the maximum specification limit of 26% w/w saponins in QET1. In reality, the levels used for flavoring or foaming purposes may be lower than this;
- All food products within a food category of interest were assumed to contain either QET1 or QET2 (based on the current and proposed uses), *i.e.*, assumed 100% occurrence;

- In cases of overlap between the proposed (QET2) and current (QET1) uses, the proposed use-levels were incorporated as they were higher;
- The likelihood of an individual consuming all of the permitted and proposed food-uses containing QET1 and QET2 within the diet over a lifetime is low, and as such, the values presented herein represent worst-case estimates of exposure.

As the exposure assessment that was presented in Part 3.2.2 of the GRAS notice incorporated all of the above conservative assumptions, the estimated intakes of saponins resulting from the current uses of QET1 and proposed uses of QET2 that were presented in Part 3.2.2 of the GRAS notice are conservative in nature. Furthermore, the cumulative assessment is considered the most appropriate as the consumption estimates take into account all sources of quillaia saponins in the diet from the current uses of QET1 and the proposed uses of QET2. The highest 90th percentile consumer-only intakes were determined to be 1.5 mg saponins/kg body weight/day and occurred in children aged 3 to 11 years resulting from the current uses of QET1 and the proposed uses of QET2 (see Table T2-1). As discussed above and in the GRAS notice, the most appropriate NOAEL on which to base the safety of the intake of QET2 is 3.0% *Q. saponaria* extract in the diet (*i.e.*, approximately 1,500 mg *Q. saponaria* extract/kg body weight/day, providing 300 mg *Q. saponaria* saponins/kg body weight/day) that was determined by the authors in the 2-year rat study (Drake *et al.*, 1982). The most appropriate NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from Drake *et al.* (1982) provides a 200-fold margin of exposure in comparison to the highest 90th percentile consumer-only intakes of 1.5 mg saponins/kg body weight/day that occurred in children aged 3 to 11 years resulting from the current uses of QET1 and the proposed uses of QET2 (see Table T2-1). On the basis that there is a sufficient margin of exposure between the most appropriate NOAEL and the highest 90th percentile estimated intake on a saponin basis, the safety of QET2 under the proposed conditions of use is supported.

Question 3

In your GRAS notice, you described the results of mutagenicity and genotoxicity testing that you performed to evaluate QET1 (Part 6.4.3, pp 40-42). However, the subject of this GRAS notice is QET2. In addition, saponins, which are the toxic substances of focus in both QET1 and QET2, are found at much higher levels in QET2 (65 – 90%) than in QET1 (20 – 26%). Please explain why the effects of QET1 was evaluated in these tests for this GRAS notice instead of the effects of QET2, and how the findings of tests evaluating QET1 provide information on the potential toxicity of QET2 given the significantly higher levels of saponins in QET2 versus QET1.

Response to Question 3

The mutagenicity and genotoxicity studies that were conducted on QET1 were commissioned on request of EFSA for the re-evaluation of quillaia extract (E 999) in the European Union (EU) (EFSA, 2019). In the EU, quillaia extract (E 999) includes both type 1 and 2 extracts. Thus, the test material had to be selected such that the mutagenic and genotoxic potential of both type 1 and type 2 quillaia extracts were evaluated. The primary distinguishable trait between the 2 extracts is the saponin content, which is notably higher for type 2 (65 to 90% w/w on dry basis) compared to type 1 (20 to 26% w/w on dry basis) based on the specifications established by JECFA for quillaia extract types 1 and 2 (JECFA, 2006a, 2014). Saponins are considered the ‘active’ component of the extracts, and the toxicity of quillaia extracts has been attributed to the saponins. Specifically, there were no differences in acute toxicity between the type 1 and type 2 extracts when assessed based on their saponin content (JECFA, 2006b). Naturex did not supply the test article for the mutagenicity and genotoxicity studies; however, data that were proprietary to the test article manufacturer demonstrated that the chromatographic profiles of the 2 extracts were virtually identical. This is in agreement with data reviewed by JECFA (2006b), where the committee concluded that the saponin profile

of the type 2 extract (prepared by membrane ultrafiltration or chromatography) and the type 1 extract prepared by chromatographic analysis were similar. Furthermore, the composition of the non-saponin component (*i.e.*, impurities) of quillaia extracts type 1 and type 2 were investigated by the test article manufacturer, and it was concluded that quillaia type 1 and 2 extracts contain similar levels of total polyphenols, tannins, polysaccharides, and proteins, whereas the levels of other carbohydrates and ash (including calcium and magnesium) were higher in the QET1. The only compositional component that was significantly higher in the QET2 was saponins.

To ensure that the components of the untested preparation were represented by the preparation that was tested, the extract type that contained the highest level of impurities (*i.e.*, type 1) was selected for the tests, while basing the dose-levels on the saponin content. This resulted in a conservative, worst-case exposure to both impurities and saponins. The concentrations and doses tested were based on regulatory maximum doses on a saponin basis or, in the case of the *in vitro* mammalian cell micronucleus test, concentrations were based on the cytotoxicity limit. The use of the regulatory maximum doses of saponins ensured that the potential toxicity of saponins was assessed and that the results would be relevant to both the type 1 and type 2 extracts. For example, in the bacterial reverse mutation assay, the doses selected for the main experiments were up to the guideline regulatory maximum dose level of 5 µL saponins/plate, which corresponded to much higher levels of 21.55 µL QET1/plate [Sequani Limited, 2018a (unpublished)]. In the *in vivo* mammalian erythrocyte micronucleus test, rats were dosed by gavage with water (negative control) or QET1 at the regulatory maximum dose of 2,000 mg/kg body weight/day saponins, which is equivalent to 8,620 mg/kg body weight/day QET1 [Sequani Limited, 2018b (unpublished)]. Target tissue exposure was demonstrated by the detection of quillaic acid (the backbone of quillaia saponins) in all plasma samples taken from satellite animals and by a statistically significant decrease in the percentage of reticulocytes in animals administered QET1 compared to controls.

Therefore, QET1 alone was used as the representative test article for evaluation of mutagenicity and genotoxicity of both quillaia type 1 and type 2 extracts. The selection of the type 1 extract is in agreement with JECFA's conclusion that the available toxicology studies on QET1 are sufficient to evaluate the toxicity of QET2 due to the similarity reported between the saponin profile of type 2 extract (prepared by membrane ultrafiltration or chromatography) and type 1 extract prepared by chromatographic analysis and considering that there were no differences in toxicity between the type 1 and type 2 extracts when assessed based on their saponin content (JECFA, 2006b).

Question 4

In Part 6, you described the results of several studies where a significant effect(s) only occurred at the highest dose tested. You then stated that the adverse effects are not dose-dependent and that this implies that these changes are not of biological significance. However, the potential adverse effect levels (or potential study LOELs) occurring at the highest dose tested may reflect the thresholds of reactivity for an effect and a dose-(or exposure-) response relationship encompassing the lower doses tested would not be expected. In turn, this makes your argument for not regarding certain high dose effects as relevant to a safety analysis problematic and not a valid one. Given this point, please provide further explanation and clarification on your decision not to consider the high dose effects as relevant to your safety assessment. Please focus on the study or studies and associated effects that you identified as pivotal to your safety assessment, along with the key study or studies and associated effects identified by JECFA and EFSA in their derivation of ADIs for quillaia extract saponins.

Response to Question 4

The key studies relevant to the safety assessment of QET2 are the 13-week subchronic study in rats (Gaunt *et al.*, 1974), the 84-week chronic study in mice (Phillips *et al.*, 1979), and the 2-year study in rats (Drake *et al.*, 1982). The pivotal study for the safety evaluation of QET2 is the 2-year study in rats by Drake *et al.* (1982).

JECFA (1982) also considered the 13-week subchronic study in rats (Gaunt *et al.*, 1974), the 84-week chronic study in mice (Phillips *et al.*, 1979), and the 2-year study in rats (Drake *et al.*, 1982). The current acceptable daily intake (ADI) determined by JECFA for quillaia extracts was established at its 65th meeting where the Committee reviewed information regarding the production and composition of type 2 extracts prepared by membrane ultrafiltration and chromatography and acute toxicity data for type 1 and 2 extracts (JECFA, 2006b). Due to the similarity reported between the saponin profile of type 2 extract (prepared by membrane ultrafiltration or chromatography) and type 1 extract by chromatographic analysis, the Committee concluded that no further toxicity studies on quillaia type 2 extracts were required. In the acute studies, there were no differences in toxicity between the type 1 and type 2 extracts when assessed based on their saponin content. The Committee considered that the toxicity of the extracts was a result of the saponin content and determined a group ADI of 0 to 1 mg/kg body weight (expressed as quillaia saponins) based on the lower end of the specified range of saponins in the type 1 extract (*i.e.*, 20%). Although not specifically stated, this is assumed to be calculated from JECFA's (1982) selected NOAEL of the mid-dose level, 1.0% in the diet (0.5 g/kg body weight/day) in the study by Drake *et al.* (1982). It is noteworthy that contrary to JECFA's chosen NOAEL, the authors of the study reported a NOAEL of 3.0% in the diet (1.5 g/kg body weight/day), the highest dose tested (Drake *et al.*, 1982).

EFSA (2019) reviewed the same repeated-dose studies on quillaia extract including a 90-day study in rats (Gaunt *et al.*, 1974), an 84-week study in mice (Phillips *et al.*, 1979), and a 2-year study in rats (Drake *et al.*, 1982). On the basis of the available data, EFSA (2019) concluded that the 2-year study in rats (Drake *et al.*, 1982) was the most comprehensive and robust and established an ADI for quillaia extract of 3 mg saponins/kg body weight/day on the basis of a NOAEL of 1,500 mg quillaia extract/kg body weight/day, factoring in that QET1 contains *ca.* 20% saponins which are the bioactive substances considered responsible for toxicity on the basis that the LD₅₀ values for the Type 1 and 2 extracts were about the same when expressed on a saponin basis.

Therefore, in all safety evaluations of quillaia extracts, including those conducted by JECFA, EFSA, and the current GRAS evaluation for quillaia extracts type 2, the same 3 repeat-dose studies (Gaunt *et al.*, 1974; Phillips *et al.*, 1979; Drake *et al.*, 1982) were considered the key studies. Furthermore, in all 3 safety evaluations, the study by Drake *et al.* (1982) was selected as the pivotal study from which to establish a point of departure for derivation of an ADI or evaluation of the safety of exposure. The significant effects that occurred at the high doses in the 3 key studies are discussed below.

In the 13-week study, the administration of 0, 0.6%, 2.0%, or 4.0% *Q. saponaria* extract in the diet¹, providing approximately 0, 70, 240, and 500 mg *Q. saponaria* saponins/kg body weight/day based on consumption data, to male and female rats was reported to result in a number of statistically significant differences in measured parameters compared to controls (Gaunt *et al.*, 1974). The significant differences that were reported in the high-dose groups and their toxicological relevance are discussed below.

¹ Saponin content not reported; however, it was assumed to be 20% based on JECFA's (2006b) conclusion that the test material in the toxicology studies was representative of a type 1 extract and the lower limit of 20% saponins in the type 1 extract.

- Significant decreases in body weight in high-dose males up to study Day 78 and in high-dose females up to study Day 14. The decreases in body weight were considered to be due to unpalatability of the quillaia extract diets. In support of this conclusion, mean intakes of feed over the entire study period were reduced in all groups fed *Q. saponaria* extract compared to sex-specific controls, and the differences achieved statistical significance in females provided diets containing 2% or 4% *Q. Saponaria*. The authors also reported that the largest difference in feed intake occurred during the beginning of the study, which is consistent with a diet that is unpalatable, wherein the rats would become accustomed to it over time and less of a difference from controls would be expected. A significant reduction in mean water intake over the entire study period was reported in males given diets containing 2% or 4% *Q. saponaria* ($P < 0.05$ and $P < 0.01$, respectively, compared to male controls), which was reported by the study authors to likely be related to the reduced feed consumption. Therefore, the significant decreases in body weight were not considered toxicologically relevant, as they were concluded to be a result of the unpalatability of the *Q. saponaria* diet.
- A significant decrease in absolute weight of the adrenals in high-dose males was not considered toxicologically relevant due to the lack of a dose-dependent response, the lack of a corresponding decrease in relative weight of the adrenals, and the absence of any corresponding histopathological effects. The absolute weights of the adrenals were lower (not statistically significant) in the low-dose male group than in the mid-dose male group, and the weight in the low-dose group was similar to the high-dose group, thus demonstrating the absence of a dose-response. The weights are also not supportive of a threshold effect, due to the similarity in weight between the low-dose group (58 g) and the high-dose group (56 g), while the control group (65 g) and mid-dose group (64 g) were similar. Furthermore, when assessed relative to body weight, there were no significant differences in adrenal weights among the dose-groups, meaning that the observed decreases in absolute weight can be accounted for by differences in body weights. The gold-standard for the evaluation of adrenal changes is histopathological examination (Inomata and Sasano, 2015), and there was no evidence of any histopathological changes in the adrenals in the study by Gaunt *et al.* (1974). Therefore, it is concluded that the significant decrease in the absolute weight of the adrenals in high-dose males is not toxicologically relevant.
- The absolute weight of the kidneys in mid- and high-dose males were significantly decreased compared to controls, while the relative weight of the kidneys in high-dose females was significantly reduced compared to controls. These changes were not considered toxicologically relevant as they were not consistent between the sexes and there were no corresponding hematological, serum biochemical, urinalysis, or histopathological effects. Furthermore, the decrease in absolute weight in males was not dose-responsive, as the weight in the mid-dose male group (2.28 g) was less than the weight in the high-dose male group (2.55 g), and thus there was no evidence of a threshold effect. In females, there were no significant differences in absolute weights of the kidneys; however, the relative weight of the kidneys decreased in a dose-responsive manner, albeit very slightly. The relative kidney weights were 0.60, 0.59, 0.58, and 0.57 g/100 g body weight in the control, low-, mid-, and high-dose groups; however, the statistically significant, small decrease in the high-dose group relative kidney weight was not concluded to be a threshold effect due to the lack of corresponding serum hematological, biochemical, urinalysis effects, or histopathological effects. Therefore, in the absence of any marker of kidney injury indicative of a toxicological response, and noting the small magnitude of change, the decreased relative weight of the kidneys in high-dose females was not considered toxicologically relevant.

- The significant decreases reported in the absolute and relative weights of the liver in mid- and high-dose males compared to controls were not considered adverse effects as there were no significant differences in liver enzymes [aspartate aminotransferase (AST), alanine aminotransferase (ALT), or lactate dehydrogenase (LDH)] and no evidence of histopathological alterations in any dose groups. Due to the lack of any corresponding changes indicative of a toxicological response, the changes in liver weights were not considered to be an adverse toxicological effect.
- The significant increase in relative weight of the brain in high-dose males was not considered toxicologically relevant as there were no histopathological correlates and no evidence of a dose-responsive effect. The relative weights of the brain were 0.41, 0.44, 0.43, and 0.43 in the control, low-, mid-, and high-dose males, which demonstrates that the relative weight in the low-dose group was higher than in the high-dose group, and therefore, does not support the occurrence of a threshold effect. There were no statistically significant changes in the absolute brain weights in any sex or in relative brain weight in females, indicating that the slight, but statistically significant increase in relative brain weight in males was a reflection of the lower terminal body weights associated with unpalatability of the diet.
- The significant increase in relative weight of the stomach in mid- and high-dose males and high-dose females compared to controls was suggested by the study authors to potentially be a result of local irritant effects; however, there were no effects suggestive of gastrointestinal (GI) irritation (including diarrhea) reported in the study in any of the rats consuming *Q. saponaria* extract. Furthermore, there were no histopathological changes in the stomach. Thus, there was no histopathological evidence to support either the proposed mechanism of effect or the presence of an adverse toxicological response. Due to the lack of corresponding histopathological changes, the increased weights of the stomach were not considered to be an adverse toxicological response.
- The significant increase in relative weight of the cecum in high-dose females was not considered toxicologically relevant due to the lack of corresponding histopathological changes, the absence of a significant difference in the males, and a lack of effect on the absolute cecal weight.
- In summary, the reported changes in organ weights did not result in any adverse effects on organ structure or function based on the lack of hematological, serum biochemical, urinary, or gross or histological abnormalities. As such, the reported significant differences were not considered to be toxicologically relevant.

The administration of 0, 0.1%, 0.5%, or 1.5% *Q. saponaria* extract in the diet, equivalent to approximately 0, 28, 140, and 440 mg *Q. saponaria* saponins/kg body weight/day, respectively, to male and female mice for 84 weeks resulted in several statistically significant differences in measured parameters compared to controls (Phillips *et al.*, 1979). The significant differences that were reported in the high-dose groups and their toxicological relevance are discussed below.

- Terminal body weight was significantly reduced in high-dose males compared to controls. Although slightly lower weight gain was reported in high-dose males throughout the study, body weights were similar to controls at each individual timepoint assessed during the administration period. Although feed intake was not measured during the study, the reported decrease in terminal body weights was suggested by the study authors to have been due to the unpalatability of the test compound and local irritation of the GI tract; however, there was no evidence of GI irritation in either the current study. Unpalatability was also suggested by Gaunt *et al.* (1974), as discussed above, and the study by Drake *et al.* (1982) included a palatability study, the results of which

demonstrated that the rats preferred the control diet over the diets supplemented with quillaia extracts. Therefore, the slightly reduced weight gain and significantly lower terminal body weight of the high-dose male rats compared to controls was considered to be a result of the unpalatability of the quillaia extract diet and not an adverse toxicological response.

- A significant decrease in red blood cells (RBC) was reported in mid and high-dose males and high-dose females at study Week 26; however, at Week 84 (end of study), RBC were significantly decreased in the mid-dose males only. There were no significant differences from controls in the male or female high-dose groups. As the significant differences in the high-dose groups were transient in nature and not present at the end of the study, the differences reported mid-study were not considered to be toxicologically relevant.
- Packed cell volume (PCV) was significantly increased in high-dose males at Week 84; however, PCV was significantly decreased in mid-dose females at the same timepoint. Due to the opposing directions of the changes in the male and female rats at Week 84, the significant increase in high-dose males was not considered to be an adverse toxicological effect.
- The absolute weight of the kidneys was significantly decreased in high-dose males; however, there were no significant differences in relative kidney weight, meaning that the observed decreases in absolute weight can be accounted for by differences in body weights. Furthermore, there were no histopathological changes indicative of an adverse effect; the degenerative changes that were reported in the kidneys occurred more frequently in the male control mice (11) than in the male high-dose group (9). In addition, there were no significant differences in absolute or relative weights of the kidneys in females. Due to the lack of a corresponding significant difference in relative weight, lack of histopathological alterations, and the lack of a difference in females, the difference in absolute weight of the kidneys in high-dose males was not considered to be toxicologically relevant.
- The absolute weight of the liver was significantly decreased in high-dose males; however, there were no significant differences in relative weights of the liver, meaning that the observed decreases in absolute weight can be accounted for by differences in body weights. Furthermore, there were no significant differences in histopathological changes between the high-dose males and the controls. The incidences of focal areas of vacuolation were 12, 12, 5, and 14 in the control, low-, mid-, and high-dose male groups and were 23, 16, 22, and 14 in the control, low-, mid-, and high-dose female groups. The incidences of severe fatty change were 5, 3, 9, and 3 in the control, low-, mid-, and high-dose male groups and 7, 9, 5, and 1 in the control, low-, mid-, and high-dose female groups. Therefore, on the basis that the significant difference in absolute weight of the liver was not mirrored by a significant difference in liver weight relative to body weight and that there were no significant differences in histopathological changes compared to the control group, it was concluded that significant decrease in absolute weight of the liver was not the result of an adverse effect of quillaia extract.
- A significant increase in absolute weight of the small intestine was reported in high-dose females; however, when expressed relative to body weight, there were no significant differences compared to the control group. There were no histopathological changes in the GI tract of the high-dose females. Therefore, the increased weight of the small intestine in high-dose females was not considered to be an adverse toxicological response.

- The absolute weight of testes was significantly decreased in mid- and high-dose males; however, when expressed relative to body weight, there were no significant differences compared to the control group. Thus, the observed decrease in absolute weight can be accounted for by differences in body weights. Furthermore, there were no histopathological changes indicative of an adverse effect; atrophy and foci of chronic inflammation in seminal vesicles were reported more frequently in the control mice (3 and 3, respectively) than in the male high-dose group (1 and 0, respectively). Therefore, the significant decrease in absolute weight of the testes was not considered to be an adverse toxicological response.
- The relative weight of the brain was significantly increased in high-dose males; however, there were no histopathological changes indicative of an adverse effect. There were no changes in absolute brain weights indicating the change in relative weights was a reflection of the differences in terminal body weights. Due to the lack of corresponding histopathological changes, the increased relative brain weight was not considered toxicologically relevant.
- The relative weight of the stomach was significantly increased in high-dose males. In histopathological examinations, chronic inflammation and degenerative changes were reported in the GI tract with incidences of 0, 2, 1, 3 for the male control, low-, mid-, and high-dose groups and 1, 0, 0, 0 in the female control, low-, mid-, and high-dose groups; however, the incidences in the dose-groups were not significantly different from the control groups. Although the incidence of these changes was highest in the male high-dose group, the male mid-dose group had a lower incidence than the male low-dose group, and none of the difference were significant. Additionally, there were no histopathological changes in any of the female groups, and the changes were reported for the entire GI tract, meaning it is not possible to determine whether they occurred in the stomach or not. Given that the incidences of histopathological alterations in the GI tract were not significantly different from controls, there were no histopathological changes in the females, and there would be no reason to expect a sex-specific effect on the stomach, the increase in the high-dose males was not considered to be toxicologically relevant.
- In summary, none of the significant differences were accompanied by any other evidence of an adverse toxicological effect, and as such, they were not considered to be toxicologically relevant.

The provision of diets containing 0%, 0.3%, 1.0%, or 3.0% *Q. saponaria* extract, providing approximately 0, 30, 100, and 300 mg *Q. saponaria* saponins/kg body weight, respectively, to male and female Wistar rats for 2 years resulted in several statistically significant differences in measured parameters compared to controls (Drake *et al.*, 1982). The significant differences that were reported in the high-dose groups and their toxicological relevance are discussed below.

- Body weight was significantly reduced in high-dose males at Week 4 and from Weeks 42 to 89; however, no significant differences in body weight were noted between groups at the end of the study at Week 106. The significantly lower body weights were attributed to the non-significantly reduced feed intake in the high-dose male and female groups throughout the study compared to sex-specific controls. The reduced feed intake was considered to be a result of the unpalatability of the quillaia extract diets, as in preliminary tests, rats avoided the diets containing quillaia extract, and in the previous 13-week study by Gaunt *et al.* (1974), rats receiving 2% and 4% quillaia extracts had decreased feed intake at the beginning of the study. Drake *et al.* (1982) noted that “*these factors support the suggestion that the diet was unpalatable and the changes observed cannot be considered to be a sign of toxicity*”. Therefore, on the basis that the reduced body weights in the high-dose males at various timepoints in the study were the result of reduced feed intake due to

unpalatability of the diet, the reduced body weights are not considered to be toxicologically relevant.

- WBC were significantly increased at Weeks 15 and 25 in high-dose males and significantly decreased at the end of the study (Week 108) in high-dose male and female groups compared to controls. Significant decreases in body weight in high-dose males and non-significant decreases in body weight in high-dose females in the second half of the study and food consumption of both male and female high-dose groups throughout the study were reported compared to the controls, which led the authors to suggest that the reduction in terminal white blood cell counts in the high-dose animals was likely “*a reflection of the decreased growth rate*”, as decreased food intake and body weights were previously reported to be associated with a decrease in white blood cell counts (Oishi *et al.*, 1979). Drake *et al.* (1982) also noted that total white blood cell counts were significantly increased at Weeks 15 and 25 in males but not females in the current study, and not affected by consumption of *Q. saponaria* extract in the 90-day study in rats by Gaunt *et al.* (1974). Drake *et al.* (1982) concluded that due to the inconsistencies in the results, the observed differences from controls in white blood cell counts were not compound-related (Drake *et al.*, 1982). On the basis that the reductions in WBC counts can be attributed to reduced growth rates due to decreased feed intake resulting from the unpalatability of the diets, the significant differences were not considered to be toxicologically relevant.
- Transient significant increases in neutrophils and significant decreases in lymphocytes at study Week 15 in high-dose males were reported. Due to the transient nature of these changes and the lack of a significant difference at later timepoints, including at the end of the study, the significant differences were not considered to be adverse or toxicologically relevant.
- The absolute and relative weights of the full and empty cecum were significantly increased in the low- and high-dose females. As this effect was not consistent among the groups administered quillaia extracts (*i.e.*, the difference was observed in the low- and high-dose female groups and not in the mid-dose female group and there were no significant differences from control in the male groups), the study authors concluded that the differences were not test article related. Furthermore, there were no histopathological changes to suggest an adverse toxicological effect.
- The absolute weight of the heart was significantly decreased in high-dose males; however, when expressed relative to body weight, there were no significant differences compared to the control group. Thus, the observed decrease in absolute weight can be accounted for by differences in body weights. Additionally, the authors suggested that the delayed growth could have resulted in delayed onset of renal changes that occur with normal aging and a delay in concomitant ventricular hypertrophy (Berg, 1967), which could also account for the decreased absolute heart weight in the high-dose males. The only histopathological change was a non-significant decrease in the incidence of fibrosis in the heart in the high-dose male group (n=7) compared to the control group (n=11), indicating that there was no evidence of an adverse toxicological response from the quillaia extract diets. For all of these reasons, the decrease in absolute weight of the heart in high-dose males was not considered to be an adverse effect of the test article or toxicologically relevant.

- The absolute weight of the kidneys was significantly decreased in high-dose males; however, when expressed relative to body weight, there were no significant differences compared to the control group. Thus, the observed decrease in absolute weight can be accounted for by differences in body weights. Additionally, there were no changes in serum biochemistry or histopathological examinations indicative of an adverse effect of quillaia extracts. Based on the lack of significant differences in relative kidney weight and the lack of adverse changes in serum biochemical and histopathological examinations, the decrease in absolute weight of the kidneys in high-dose males was not considered to be toxicologically relevant.
- The absolute weight of the small intestine was significantly increased in low- and high-dose females, and the relative weight of the small intestine was significantly increased in high-dose females. As the differences were observed in both the low- and high-dose female groups, but not the mid-dose female group or any of the male groups, the authors concluded that due to the inconsistencies in the significant differences that they were not compound-related. Additionally, there were no corresponding histopathological changes indicative of an adverse effect of quillaia extract. Therefore, due to the inconsistent nature of the differences and the lack of corresponding histopathological changes, the increased absolute and relative weights of the small intestine in the high-dose females is not considered to be an adverse effect of quillaia extract.
- The absolute weight of the thyroid was significantly decreased in high-dose males; however, when expressed relative to body weight, there were no significant differences compared to the control group. Thus, the observed decrease in absolute weight can be accounted for by differences in body weights. The authors also suggested that the decreased absolute thyroid weight might be related to a delay in hyperplasia of the parathyroid due to the delay in nephrosis in the high-dose males, which in turn was suggested due to the decreased body weights of the high-dose males that resulted from the unpalatability of the diet. In support of this theory, there was a non-significant decrease in the incidence of enlarged parathyroids in the high-dose males (n=3) compared to the control males (n=5). For these reasons, the decreased absolute thyroid weight was not considered to be toxicologically relevant.
- The relative weight of the liver was significantly increased in high-dose females and significantly decreased in mid-dose males compared to controls. These changes were not dose-responsive as the relative weight of the liver in high-dose females (3.05 g/100 g body weight) was similar to that in the low-dose group (3.00 g/100 g body weight), while the control and mid-dose groups were similar (2.71 and 2.66 g/100 g body weight, respectively). Similarly, the changes in the males were not dose responsive, as the relative weight in the high-dose group (2.49 g/100 g body weight) was higher than the relative weight in the mid-dose group (2.33 g/100 g body weight). These results do not suggest a threshold effect. There were no significant differences in liver enzymes (AST, ALT, or LDH) between the dose-groups and the controls. The incidence of mild to moderate hepatocyte vacuolation and fatty change in the high-dose females was significantly less than the controls, while all other dose groups had similar incidences as controls. There were no significant differences between controls and any male or female dose-group in the incidence of severe hepatocyte vacuolation and fatty change. Based on the lack of corresponding serum biochemical or histopathological effects indicative of a toxicological response, the significant increase in relative weight of the liver in high-dose females was considered incidental and not related to the administration of quillaia extracts.

- The relative weight of the stomach was significantly increased in high-dose females; however the relative weight of the stomach in high-dose females (0.54 g/100 g body weight) was similar to the relative weight of the stomach in the low-dose females (0.53 g/100 g body weight). In the histopathological examinations, the incidence of glandular dilatation of the stomach was significantly higher in the low-dose group (n=9) compared to the controls (n=2), while the incidence in the high-dose group was non-significantly increased compared to controls (n=6). As the difference in concentration of quillaia extracts in the diet was 10-fold higher in the high-dose group compared to the low-dose group, these results suggest neither a threshold effect nor an effect of quillaia extracts. Additionally, there were no significant differences in stomach weight or histopathology of the stomach in the male dose-groups compared to controls. Based on the inconsistencies of the responses with respect to both weight and histopathological changes, the increased relative weight of the stomach in high-dose females was not considered to be related to quillaia extracts and hence not toxicologically relevant.
- A significant increase in the specific gravity of urine produced in the 4-hours period following water deprivation for 16 hours in high-dose males was reported. No significant differences were observed at any other timepoint (Weeks 13 and 24) in the males or in the females at any timepoint. There were no significant differences serum biochemistry parameters, and the incidences of histopathological changes, consisting of mild-to-moderate and severe glomerulonephrosis, were not significantly different between the dose-groups and the controls. The only significant histopathological change was a significant decrease in calcium deposits in the mid-dose females. Thus, there was no supporting biochemical or histopathological evidence of an adverse effect on the structure or function of the kidney. As such, the significant increase in specific gravity in the high-dose males was considered incidental and not toxicologically relevant.
- The only other significant differences in histopathological effects at the high-dose level were significant decreases in peribronchiole chuffing in the lung and pigmentation in the harderian gland in high-dose females. These changes were not considered toxicologically relevant as their incidence was significantly lower in the high-dose group than in the controls.
- In summary, none of the significant differences from controls reported in the high-dose groups were considered to be related to the administration of quillaia extracts and none were considered toxicologically relevant.
- Based on the results of the study, the highest concentration tested, 3% *Q. saponaria* extract in the diet (*i.e.*, approximately 1,500 mg *Q. saponaria* extract/kg body weight/day, providing 300 mg *Q. saponaria* saponins/kg body weight/day), was selected as the NOAEL by the study authors. This NOAEL was selected due to the lack of significant differences between-groups in cumulative deaths, as well as a lack of compound-related, dose-dependent adverse effects on body and organ weights, hematology, serum biochemistry, urinalysis, and gross/histopathology.
- As noted in the GRAS notice for QET2, the lack of consistent compound-related, dose-dependent adverse effects is consistent with the low oral bioavailability of saponins and the expected low oral bioavailability of quillaia saponins (see Part 6.3.2 of the GRAS notice).

Overall, when considering the toxicological relevance of the reported significant differences at the high-dose levels in the 3 key studies (Gaunt *et al.*, 1974; Phillips *et al.*, 1979; Drake *et al.*, 1982), none of the significant differences were not considered to be toxicologically relevant on the basis of them only occurring in the high-dose group. In all instances there was no corresponding hematological, serum biochemical, urinalysis, and/or gross or histopathological evidence of an adverse effect of quillaia extract. As such, there is no evidence to support that a threshold effect may be occurring. Therefore, the significant differences were not considered to be related to the administration of quillaia extract and were not considered to be toxicologically relevant.

Question 5

In Part 6, you described the results of several studies where a significant effect(s) only occurred in one sex group. You then stated that the many of potential adverse effect(s) are not relevant because only one sex exhibited the agent-induced change in response. However, a core principle of toxicological risk assessment is to identify the most sensitive adverse effect(s) in the most sensitive population or group upon which to base a determination of a level of toxicological concern. Thus, an effect seen in only one sex (i.e., females vs. males) may reflect a possible critical adverse event. Given this point, please provide further explanation and clarification on your interpretation of sex-specific study findings and decision not to consider sex-specific effects as relevant to your safety assessment. Please focus on the study or studies and associated effects that you identified as pivotal to your safety assessment, along with the key study or studies and its effects identified by JECFA and EFSA in their derivation of ADIs for quillaia extract saponins.

Response to Question 5

As discussed in response to Toxicology Question 4 above, the 3 key studies in the safety assessment of QET2 were the 13-week subchronic study in rats (Gaunt *et al.*, 1974), the 84-week chronic study in mice (Phillips *et al.*, 1979), and the 2-year study in rats (Drake *et al.*, 1982). The pivotal study for the safety evaluation of QET2 is the study by Drake *et al.* (1982). These same 3 repeat-dose studies were also considered the key studies in the safety evaluations by JECFA and EFSA. Furthermore, in all 3 safety evaluations, the study by Drake *et al.* (1982) was selected as the pivotal study from which to establish a point of departure for derivation of an ADI or evaluate the safety of exposure.

All significant differences from controls in the high-dose groups in the 3 key studies were discussed above in response to Toxicology Question 4. As discussed above, in all cases, additional evidence including a lack of corresponding hematological, serum biochemical, urinalysis, and/or gross or histopathological evidence was relied on to assess whether or not a reported significant effect was toxicologically relevant. In some of the discussions, the inconsistencies between the responses in the male and female groups formed part of the basis for the conclusion that an effect was not test article-related; however, in no case was such an inconsistency relied upon as the primary or the only evidence to support that a significant difference was not test article related. In all cases, regardless if they were specific to one sex or not, the significant differences were not considered to be the result of an adverse effect of quillaia extract.

Question 6

In Part 6.7 on pp 46-48, you discuss the relationship between exposure to quillaia extracts, quillaia saponins, and bile metabolism. Quillaia saponins and bile acids have chemical structure and functional similarities, and thus, the potential for interaction. Please address the following:

- On pp 48 in the second paragraph, you described and drew conclusions about the results on liver weights in short-term studies (e.g., Oakenfull *et al.*, 1979; Afrose *et al.*, 2009) of a duration of 3-4 weeks and compared them, along with the related levels of saponin exposure, to the findings of a two-year study. Please discuss the consideration of the effects of “duration of exposure” and the levels of exposure (i.e., “dose”) to an agent, in this case, saponin in the outcome of these studies.
- Considering the points raised above in question 5 and 6, please discuss the conclusion stated by you on pp 48 on the relationship between quillaia extract saponins exposure, bile acid and liver weight.
- Please BRIEFLY address the differences between the sexes with respect to bile acids. Please also discuss the possible contribution of this “sex effect” on the outcome of exposure to saponins on bile acids and liver weight.

Response to Question 6

Part 6.7 of the GRAS notice for quillaia extracts type 2 was included to examine the potential for interactions between saponins and bile acids based on the theoretical potential for such an interaction. Outcomes that may be altered, if an effect were to occur, included liver weights (decreased), glucose homeostasis, serum phospholipids, triglycerides and total cholesterol, and hepatic glucagon and lipid content. It should be noted that there is no evidence of any overt interaction between quillaia saponins and bile acids in any of the toxicology studies. The results of these studies indicate that any interaction (if it occurs at all) is not toxic in nature. In response to the specific questions above, please see below.

Response to Question 6a

The evidence presented in Part 6.7, page 48, second paragraph, was included to demonstrate that the potential for an interaction between saponins and bile acids was investigated and to highlight that there was no effect on liver weight in any of the identified studies at doses ranging from 6 mg quillaia saponins/kg body weight/day to 600 mg European soapwort saponins/kg body weight/day for triterpene glycoside saponins (Oakenfull *et al.*, 1979; Afrose *et al.*, 2009; Shi *et al.*, 2014) and at doses of 1,540 and 2,560 mg ethanol extract of defatted fenugreek seeds/kg body weight with unknown steroidal saponin content (Stark and Madar, 1993). As these studies are short-term in duration (3 to 8 weeks), evidence from the toxicology studies conducted with quillaia extracts was discussed to demonstrate that long-term administration of quillaia extracts (i.e., for 13 weeks to 2 years) resulted in no consistent effect on liver weight (Gaunt *et al.*, 1974; Phillips *et al.*, 1979; Drake *et al.*, 1982). A comparison was also made between the highest level at which no effect on liver weight was observed in the short-term studies (i.e., 600 mg/kg body weight/day) and the NOAEL for quillaia saponins (i.e., 300 mg/kg body weight/day) determined in the 2-year study in rats by Drake *et al.* (1982). It was noted that the short-term dose was twice as high as the NOAEL to highlight that short-term administration of a related saponin at a high comparative dose had no effect on liver weight. However, the conclusion on the lack of adverse effects of quillaia on liver weight was made on the basis of the results from the toxicology studies, which ranged in duration from 13 weeks to 2 years. The most appropriate NOAEL from these toxicology studies [i.e., 300 mg saponins/kg body

weight/day from the 2-year study by Drake *et al.* (1982)] was used in the safety assessment of QET2 and the doses from the short-term studies on related saponins were not taken into further account.

Therefore, with respect to duration of exposure, both the short-term studies on related saponins and the long-term studies on quillaia extracts provide no evidence to support that there is an adverse effect of quillaia saponins on bile acid metabolism and more specifically, liver weight. The long-term studies on quillaia extracts are of sufficient duration to evaluate the potential for an adverse effect on liver weight. Furthermore, with respect to level of exposure, the NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from the pivotal 2-year study conducted in rats (Drake *et al.*, 1982) that was used in the safety assessment of QET2 provides an adequate margin of exposure of 200-fold in comparison to the highest 90th percentile consumer-only intakes of 1.5 mg saponins/kg body weight/day that occurred in children aged 3 to 11 years resulting from the combined current uses of QET1 and the proposed uses of QET2 (see Part 3.2.2 of the GRAS notice). In summary, taking into consideration both duration of exposure and level of exposure, there is no evidence to support that there is an adverse effect of quillaia saponins on bile acid metabolism and more specifically, liver weight.

Please see additional discussion regarding the absence of an adverse effect of quillaia saponins on bile acid metabolism, and specifically liver weight, below in response to Question 6b.

Response to Question 6b

It is assumed that the conclusion that is being referred to in this question is the following:

“In the absence of a consistent, statistically significant, dose-dependent adverse change in liver weight in the subchronic and chronic toxicology studies (Gaunt et al., 1974; Phillips et al., 1979; Drake et al., 1982), it is concluded that there is no causal relationship between the consumption of quillaia extracts and decreased liver weight”.

This conclusion was made taking into consideration the data on liver weights and corresponding toxicological endpoints from the cited subchronic and chronic toxicology studies on quillaia extracts. The evidence is discussed in further detail below, along with additional considerations of endpoints that may theoretically be affected if an interaction were to occur between saponins and bile acids.

In the 13-week study, the administration of 0, 0.6%, 2.0%, or 4.0% *Q. saponaria* extract in the diet², providing approximately 0, 70, 240, and 500 mg *Q. saponaria* saponins/kg body weight/day based on consumption data, to male and female rats was reported to result in significant decreases in absolute liver weights in all male dose-groups and significant decreases in relative liver weights in the mid- and high-dose groups in male, but not female, rats compared to controls (Gaunt *et al.*, 1974). There were no significant differences in glucose between any of the dose-groups and the controls, and no histopathological changes were reported in the liver. Furthermore, there were no significant difference in liver enzymes (AST, ALT, or LDH) in comparison to controls. No other parameters that may theoretically be affected were investigated. In this study, significant decreases in absolute and relative liver weights were reported in the mid- and high-dose male groups compared to controls, which could theoretically be indicative of a sex-specific effect; however, there were no significant differences in liver enzymes and no evidence of histopathological alterations in any dose groups. Therefore, there was no evidence that the changes in liver weight were the result of an adverse toxicological effect.

² Saponin content not reported; however, it was assumed to be 20% based on JECFA's (2006b) conclusion that the test material in the toxicology studies was representative of a type 1 extract and the lower limit of 20% saponins in the type 1 extract.

The administration of 0, 0.1%, 0.5%, or 1.5% *Q. saponaria* extract in the diet, equivalent to approximately 0, 28, 140, and 440 mg *Q. saponaria* saponins/kg body weight/day, respectively, to male and female mice for 84 weeks resulted in a significant decrease in absolute liver weight in high-dose males, but no significant differences in absolute liver weights in the low- and mid-dose male groups or any of the female dose groups compared to controls (Phillips *et al.*, 1979). Furthermore, there were no significant differences in relative liver weights in any of the male or female dose-groups compared to controls. The authors noted that *“there were no significant differences between treated and control mice in the incidence of the [histopathological] lesions and there was a tendency for fewer lesions to be seen in the group on the highest level of quillaia”*. In the liver specifically, the incidence of focal areas of vacuolation were 12, 12, 5, and 14 in the control, low-, mid-, and high-dose male groups and were 23, 16, 22, and 14 in the control, low-, mid-, and high-dose female groups. The incidences of severe fatty change were 5, 3, 9, and 3 in the control, low-, mid-, and high-dose male groups and 7, 9, 5, and 1 in the control, low-, mid-, and high-dose female groups. Neither liver enzymes nor any other parameters that may theoretically be affected by an interaction between bile acids and saponins were investigated. In this study, although there was a significant decrease in liver weight in high-dose males, when liver weight was investigated relative to body weight it was no longer different from controls. Thus, the decrease in liver weight can be accounted for by the significant decrease in terminal body weight in the high-dose male group compared to controls. Furthermore, histopathological examination revealed no evidence of a toxic effect of quillaia extract; the incidence of focal areas of vacuolation and severe fatty change were not significantly different among the groups. Therefore, there is no evidence of the administration of quillaia having any adverse effect on the lipid content of the liver, which is part of the theoretical mechanistic explanation of how quillaia might affect liver weight. The results of this study provide no evidence to suggest that quillaia interacts with bile acids to result in a toxicological adverse effect on the liver.

The provision of diets containing 0%, 0.3%, 1.0%, or 3.0% *Q. saponaria* extract, providing approximately 0, 30, 100, and 300 mg *Q. saponaria* saponins/kg body weight, respectively, to male and female Wistar rats for 2 years resulted in no significant differences in absolute liver weight in any of the male or female dose-groups compared to controls (Drake *et al.*, 1982). Relative liver weights were significantly decreased in mid-dose males compared to controls (but not significantly different at the high-dose level) and significantly increased in high-dose females compared to controls. There were no significant differences in liver enzymes (AST, ALT, or LDH) or serum glucose between any of the dose-groups and the controls. The incidence of mild to moderate hepatocyte vacuolation and fatty change in the high-dose females was significantly less than the controls, while all other dose groups had similar incidences as controls. There were no significant differences between controls and any male or female dose-group in the incidence of severe hepatocyte vacuolation and fatty change. No other parameters that may theoretically be affected were investigated. In this study, the only significant decrease in liver weights occurred at the mid-dose level for relative liver weight in males. There were no significant differences in absolute or relative liver weights in the high-dose male group; thus, the observed significant difference cannot be the result of a threshold effect and the response was not dose-dependent. As such, the observed significant difference in the mid-dose males cannot be concluded to be test article related. The significant increase in relative liver weight in high-dose females is in contrast to the theoretical effect that quillaia may have on liver weight and also was not reported in any of the other repeat dose toxicity studies on quillaia extracts. There were also no significant differences in liver enzymes in any dose group. The incidences of mild to moderate and severe hepatocyte vacuolation and fatty change were not significantly different in the male dose groups compared to controls, and there were no other histopathological changes indicative of an adverse effect; thus, there was no histopathological evidence of an adverse effect on the liver. In contrast, the incidence of mild to moderate hepatocyte vacuolation and fatty change in the high-dose females was significantly less than the controls. Together, these results provide no evidence to support that quillaia has an adverse toxicological effect on the liver and no evidence that there is an adverse interaction between quillaia saponins and bile acids

leading to an adverse effect on the liver. Based on the results of the study, the highest concentration tested, 3% *Q. saponaria* extract in the diet (*i.e.*, approximately 1,500 mg *Q. saponaria* extract/kg body weight/day, providing 300 mg *Q. saponaria* saponins/kg body weight/day), was selected as the NOAEL by the study authors. The study by Drake *et al.* (1982) is considered the pivotal study on the safety of QET2. The NOAEL that was determined by Drake *et al.* (1982) is the most appropriate NOAEL on which to base the safety of the intake of QET2.

In summary, although inconsistent effects on absolute and/or relative liver weights were reported in all 3 repeat-dose toxicology studies predominantly in male-dose groups, in none of the studies was there evidence of an adverse histopathological effect of quillaia extract. There was also no evidence of an adverse effect on liver enzymes, as these were not significantly different from controls in any dose group in the 2 studies in which they were investigated. Furthermore, there was no evidence of any alteration in glucose levels in any dose group in the 2 studies in which they were investigated. From the results of these 3 studies (Gaunt *et al.*, 1974; Phillips *et al.*, 1979; Drake *et al.*, 1982) it can be concluded that there are no consistent, statistically significant, dose-dependent adverse changes in liver weight and no causal adverse relationship between the consumption of quillaia extracts and decreased liver weight.

Response to Question 6c

On a theoretical basis, and assuming the potential for interaction of quillaia saponins with bile acid metabolism exist (there is no empirical evidence to indicate that this is in fact the case), it is possible that there could be a sex-specific effect on liver weight. This is due to known gender differences with respect to bile acid synthesis rates, farnesoid X receptor (FXR) signaling (which impacts bile synthesis and hepatic glucose and hepatic lipid homeostasis), hepatic glycogen content and glucose output, and the gut microbiota environment (De Marinis *et al.*, 2008; Gustavsson *et al.*, 2010; Chiang and Ferrell, 2018; Phelps *et al.*, 2019). Bile acid synthesis is likely affected by sex steroids which may modulate the activity of enzymes involved in the catabolism of bile acids (Phelps *et al.*, 2019). Gender differences in the processes that regulate/modulate bile acid synthesis could, therefore, modulate liver weight responses in a sex-specific manner (*i.e.*, increased bile acid synthesis in males could lead to decreased liver weights relative to females).

Although there is a theoretical potential for a sex-specific effect of quillaia saponins through potential interactions with bile acids, cholesterol metabolism, and steroidal mechanisms, as discussed above, the results from the subchronic and chronic toxicology studies on quillaia extracts provide no evidence that such an effect is occurring.

In the 13-week study in rats by Gaunt *et al.* (1974), although significant decreases in absolute and relative liver weights were reported in the mid- and high-dose male groups compared to controls, which could theoretically be indicative of a sex-specific effect, there was no evidence of histopathological alterations indicative of changes that could be related to bile acid synthesis alteration in any dose groups. Therefore, there was no evidence that the changes in liver weight were the result of an adverse toxicological effect.

In the 84-week study in mice by Phillips *et al.* (1979), although there was a significant decrease in liver weight in high-dose males, when liver weight was investigated relative to body weight it was no longer different from controls. Thus, the decrease in liver weight can be accounted for by the significant decrease in terminal body weight in the high-dose male group compared to controls. Furthermore, histopathological examination revealed no evidence of a toxic effect of quillaia extract. Thus, any potential sex-specific effect on the contributing mechanisms did not result in an adverse toxicological effect on the liver.

In the 2-year study in rats by Drake *et al.* (1982), the observed significant difference in relative liver weights in the mid-dose males cannot be concluded to be test article related, as there were no significant differences from controls in the high-dose group and there were no corresponding histopathological or serum biochemistry alterations. Therefore, there is no evidence of a sex-specific effect of quillaia extracts on liver weight in this study.

In summary, although there is a theoretical potential for an interaction between quillaia saponins and bile acids with a proposed outcome of reduced liver weight, there is no evidence of an adverse effect on the liver with respect to weight, liver function enzymes, or histopathology resulting from the consumption of quillaia extracts in the subchronic and chronic toxicity studies (Gaunt *et al.*, 1974; Phillips *et al.*, 1979; Drake *et al.*, 1982).

Question 7

In your conclusion (Part 6.9) for Part 6, Narrative and Safety Information, you indicate that Naturex QET2 is safe for its intended uses on the basis of scientific procedures because it meets food-grade specifications, it is manufactured under cGMP conditions, and it was evaluated and supported by a GRAS Panel of Experts. However, you did not state your conclusion about the safety of GRAS based on your toxicology and health effects evaluation performed in Part 6 which is the core of a “scientific procedures” analysis. Please clearly state in your own words your OVERALL CONCLUSION that Naturex QET2 (subject of this GRAS notice) is GRAS for its intended use based on the results of your assessment of the safety of exposure to your product and its contents.

Response to Question 7

The conclusion in Part 6.9 was based on the data and information presented in the GRAS notice; however, it is noted that a clear comparison of the exposure in comparison to the pivotal safety data was not reiterated in the conclusion. Therefore, the overall conclusion has been revised below to incorporate the safety of the estimated exposure in comparison to the pivotal safety data.

Naturex has concluded that the intended uses of QET2 (meeting appropriate food-grade specifications and manufactured consistent with the principles of current Good Manufacturing Practice) as described in Part 1.3 of the GRAS notice and reproduced Table C8-2 above are safe and suitable on the basis that the highest 90th percentile consumer-only intake of the active component saponins resulting from the combined current uses of QET1 and the proposed uses of QET2 of 1.5 mg saponins/kg body weight/day that occurred in children aged 3 to 11 years is 200-fold lower than the most appropriate NOAEL of 300 mg *Q. saponaria* saponins/kg body weight/day from the pivotal 2-year rat study by Drake *et al.* (1982). The study by Drake *et al.* (1982) was considered the pivotal study in the safety assessment of QET2 as it was considered the most comprehensive as it was the longest duration and included a full toxicological evaluation (*e.g.*, body weight, feed intake, water intake, hematology, serum biochemistry, organ weights, gross and histopathology, urinalysis, tumor incidence). Furthermore, the NOAEL was determined by the study authors. On the basis that there is a sufficient margin of exposure between the most appropriate NOAEL and the highest 90th percentile estimated intake on a saponin basis, the intended uses of Naturex's QET2 as described in Part 1.3 of the GRAS notice and reproduced Table C8-2 above are concluded to be GRAS on the basis of scientific procedures. General recognition of Naturex's GRAS conclusion is supported by the unanimous consensus rendered by an independent Panel of Experts, qualified by experience and scientific training, to evaluate the use of QET2 in food, who similarly concluded that the proposed uses of QET2 are GRAS on the basis of scientific procedures.

TEST REPORT N° QL: 160311

CLIENT INFORMATION

Name / Company name Chile Botanics Spa.
ID 76.157.513-9
Address Panamericana Sur KM. 297
City Linares
Phone Number 977778870

SAMPLE IDENTIFICATION

Order Number 0000037641 **Lab code** 0000168356
Date Received 2020-08-06 **Sampled by** Client
Date Reported 2020-08-12 **Sampling Date and Time** -
Sample ID Extracto de Quillay Líquido, AC900016 Q344/001/D19
Sample Type FOOD

RESULTS

Analysis: Multi-residues of Pesticides

Methodology QuEChERS GC-MS and LC-MS/MS

Parameter	Result	Unit	L.O.Q.
ND	--	--	--

OBSERVATIONS

- Ref. N°69396
La Información proporcionada por el cliente es de su exclusiva responsabilidad
- ND: Not Detected.
- Analysis subcontracted to accredited external laboratory.
- The total screening analyzed is attached.
- [5] Testing subcontracted to external laboratory.

ANNEX B

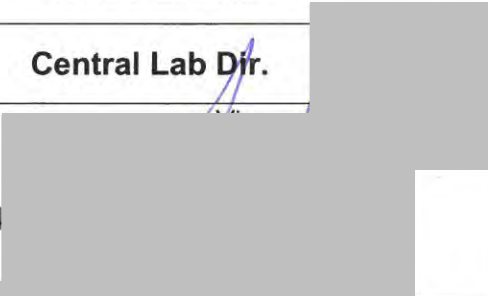

Methods of Analysis and Laboratory Accreditations

**DETERMINATION OF TOTAL SAPONINS CONTENT IN QUILLAJA
EXTRACTS:
High Performance Liquid Chromatography Method**

MODIFICATIONS

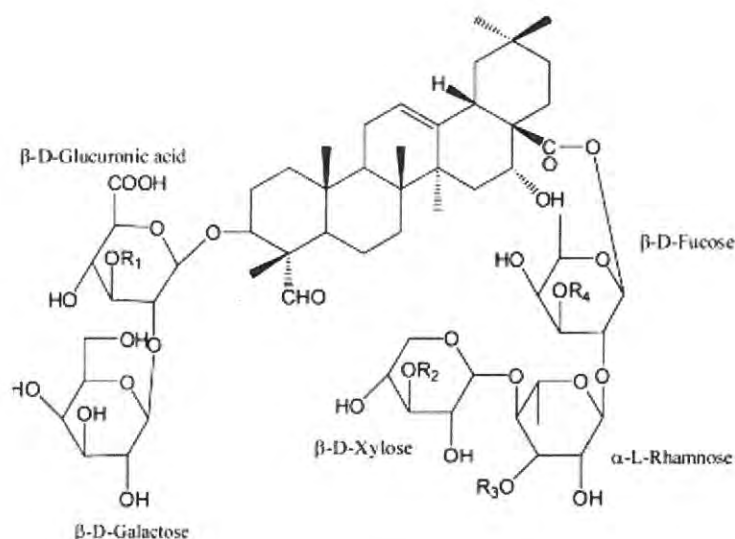

Revision	Date	Changes	Needed Training
A	13/11/2012	Creation.	yes
B	06/26/2014	Modification following JECFA monograph	no

Server adress: M:\MQ\Contrôle Qualité (CQ)\CQ-MO-xxxAccess: all QC Staff**ORIGINAL**

Developed and written by:		Approved by :	
P.BELLENGER		N. FEUILLERE	
Central lab Chemist		Central Lab Dir.	
Date	Visa	Date	
06/26/2014		06/26/2014	

1. SCOPE AND FIELD OF APPLICATION

This procedure is setting guidelines for total Saponins quantification in Quillaia extracts.

General structure of Quillaia Saponins. R1-R4 represents either H or different sugar groups.

2. PRINCIPLE

The Saponins QS-7, QS-17, QS-18 and QS 21 are separated by reverse phase High Performance Liquid Chromatography with external standard Calibration. Their quantitation is used as an indicator for total Saponins content in liquid and powder extracts containing Quillaia saponins (QS).

References

- 65th JECFA (2005).
- 61th JECFA (2001).
- Journal of the Science of Food and Agriculture, **80**:2063-2068, Ricardo San Martín and Reinaldo Briones, July 2000.

3. MATERIAL AND REAGENTS

3.1 Material

- HPLC Agilent 1200, equipped with UV-Vis detector (DAD) or equivalent.
- Vydac 214TP54 HPLC column, 5 μ m, 4.6 x 250 mm, or equivalent C₄ or equivalent. Depending on column manufacturer, a shift in retention time can be observed.
- Ultrasonication bath.
- Analytical balance (0.01 mg).
- 20 and 10 mL volumetric flasks.
- 0.45 μ m Regenerated Cellulose (RC) syringe filters.

3.2 Reagent

- Acetonitrile, far UV HPLC quality.
- Water, HPLC quality.
- Trifluoroacetic acid (TFA), HPLC quality.

3.3 Standard

- Purified Quillaia Saponins Supersap, (Natural Response, Chile) CAS # 68990-67-0. With known purity.

4. CHROMATOGRAPHY

4.1 HPLC specification

- Column: Vydac 214 TP54 C₄ 4,6 x 250 mm - 5 µm particle size or equivalent
- Column temperature: 25°C
- Flow Rate: 1.0 mL/ minute
- Detection: 220 nm, 8 nm bandwidth
- Injection volume: 20 µL
- Mobile Phase:

Time [min]	Water with 0.15% TFA [%]	Acetonitrile with 0.15% TFA [%]
0.00	70	30
40.00	55	45

Re-equilibrate at starting mobile phase conditions for at least 10 minutes after each run.

4.2 Nominal pressure

The indicative pressure for this method under described condition is 90 Bars.

5. PROCEDURE

5.1 Standard solution (15 mg/ml)

- Accurately weigh about 150 mg of SuperSap Standard into a 10 mL volumetric flask.
- Dilute to volume with water HPLC grade. Mix and sonicate
- Cool to room temperature, filter an aliquot through 0.45 µm syringe filter into a 2ml HPLC vial and cap.
- Inject 20 µL to HPLC and record resulting chromatogram integrating the total area of concerned saponins from QS-7 group to QS-21.

5.2 Quillaja extracts

- For extracts containing around 30% Saponins transfer about 500 mg of the sample, accurately weighed to 10 ml volumetric flask.
- Sample weight need to be adjusted following the expected content of Quillaja Saponins in order to keep a sample solution a 15mg/ml total saponins.
- Make up to volume with water HPLC grade. Homogenize and sonicate.
- Cool to room temperature, filter an aliquot through 0.45 µm syringe filter into a 2ml HPLC vial and cap.
- Inject 20 µL to HPLC and record resulting chromatograms integrating the total area of concerned saponins from QS-7 group to QS-21.

6. CALCULATION

The concentration of saponins, C_{sap} , in mg/ml, in the solution prepared as directed under sample preparation is:

$$C_{sap} = (A_{sample}/A_{standard})C_{Standard}$$

Where:

$C_{Standard}$ (mg/ml) is the saponins concentration of the standard injected taking in account the exact purity of the lot of standard used. (e.g., $C_{Standard} = 13.5$ mg/ml if the saponins content of 1.5 g of standard sample is 90 %)

A_{sample} and $A_{standard}$ are the sums of the peak areas attributed to the principle saponins in the sample preparation and in the standard preparation. (Tannins and polyphenols will elute before the saponins. The peaks corresponding to the saponins will appear after the major peak corresponding to the polyphenols)

The percentage of saponins in the test sample is:

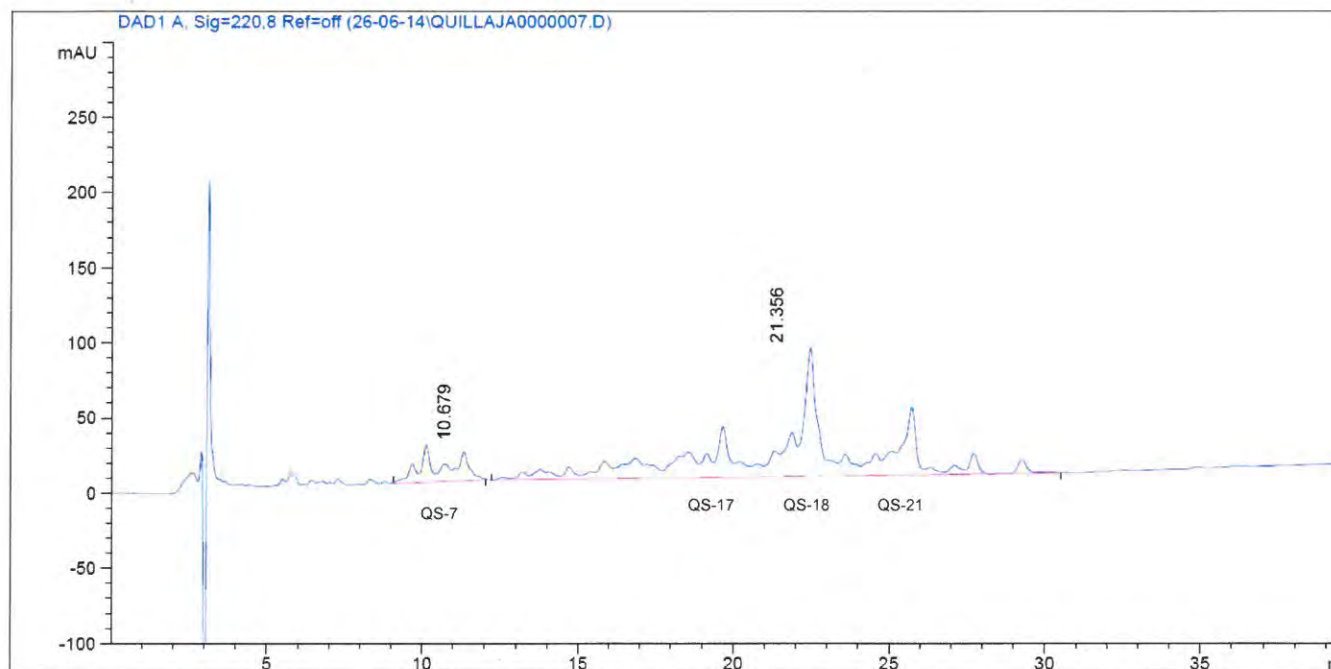

$$\% \text{ Saponins} = 100 \times C_{sap}/(0.1W_{sample})$$

Where:

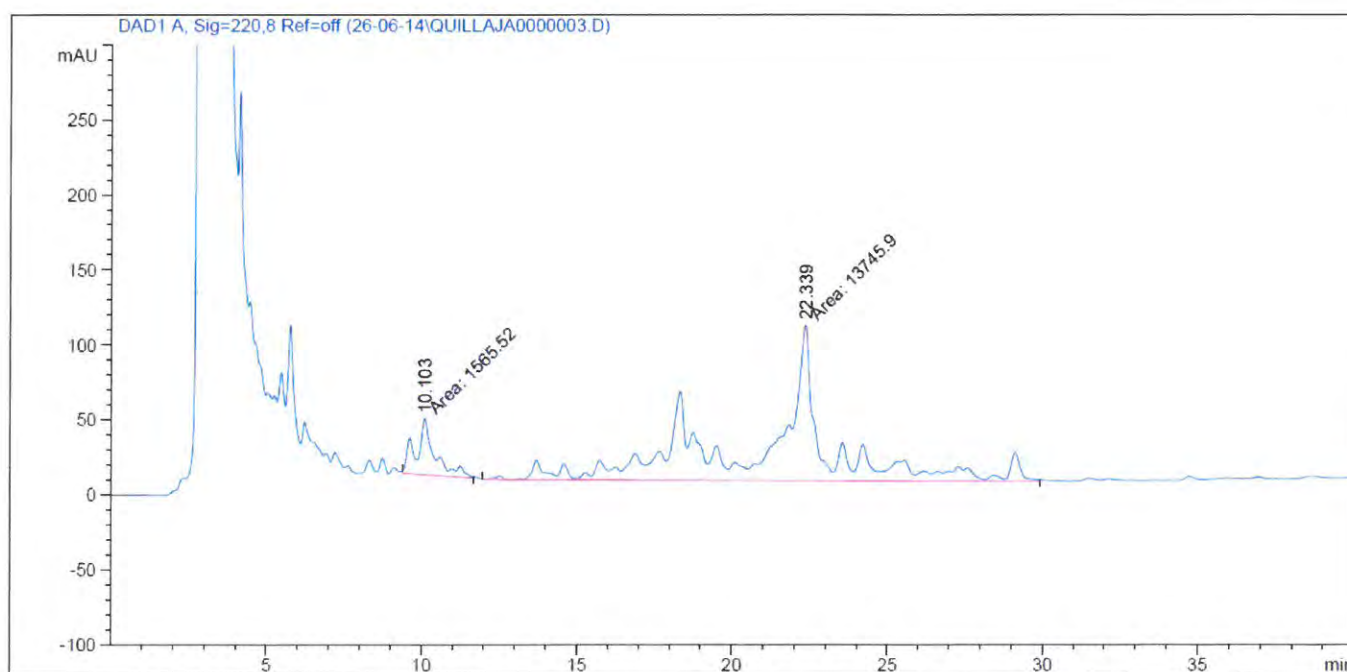

W_{sample} is the weight of the sample (mg) taken for the sample Preparation and 0.1 is the inverse of the sample volume, 10 ml.

7. Chromatograms:

Super Sap chromatogram at 15 mg/ml:

Quillaia extract chromatogram:

DRY MATTER CONTENT by I.R. dessication

*This method can be used for **plant** extracts.*

1. SCOPE AND FIELD OF APPLICATION

Dry matter content method for:

- Spray dried products (including spray dried essential oils)
- Alcoholic extracts
- Vegetable extracts

2. PRINCIPLE

There is a wide variety of moisture sources in a sample such as water, alcohols, aromatic substances, etc. This method describes a thermogravimetric method by infra-red desiccation at 100°C to determine the global moisture content. A major part of infra-red rays penetrates into the sample where they turn to calorific energy.

A small part of the rays is reflected by the sample and the penetration of IR rays depends on the permeability (thermic conductivity) of the sample. In order to provide reproducible results, it is therefore very important to have a sample spreaded on the disk on a layer as homogeneous as possible.

3. MATERIAL AND REAGENTS

3.1 Material

- Infra red desiccator SATORIUS MA 45,
- Aluminium dish,
- Filter disk (Fiorini, dim. 90 mm, Ref. 0227A00004).

3.2 Reagent

None.

4. PROCEDURE

- Check that the desiccator is on program 3 (100 °C, 9mg/24s).
- Open the desiccator.
- Place an aluminum dish (and a filter if the sample is liquid).
- Press Enter (TARE appears on the screen).
- Press Enter (TARE message disappears).
- Weigh approximately 3 g of the sample on the dish and spread the sample to have an homogeneous layer.
- Close the desiccator. The measurement will start automatically.
- When the END message appears, read the result on the screen (%L: moisture content).
- Take out the dish and wash it.

5. RESULTS

Read the result on the screen: moisture content in %wt.

6. ENCLOSED DOCUMENTS

None.

ASH CONTENT by gravimetry

*This method can be used for **plant** extracts.*

1. SCOPE AND FIELD OF APPLICATION

Quantification of total ash, sulphated ash and ash insoluble in hydrochloric acid.

This method is notably applied to **plant** extracts.

2. PRINCIPLE

2.1 Total ash

The total ash are inorganic compounds which stay in a sample after having being highly heated. Sample is incinerated at $600^{\circ}\text{C} \pm 25^{\circ}\text{C}$. The residue is weighed. Result is approximate as there may be a loss of substances by volatilization, or a weigh increase caused by carbonates or oxides formation.

Reference: **European Pharmacopoeia, 4th edition, 2002, 2.4.16 p.95.**

2.2 Sulphated ash

Sulfated ash is used to quantify mineral substances by targeting them by a reaction with sulfuric acid to provide oxides. Sample reacts with sulfuric acid and is incinerated at $600^{\circ}\text{C} \pm 25^{\circ}\text{C}$. The residue is weighed.

Reference: **European Pharmacopoeia, 4th edition, 2002, 2.4.14 p.95.**

2.3 Ash insoluble in hydrochloric acid

Total ash or sulphated ash is treated by boiling hydrochloric acid. The final residue is weighed. This insoluble residue is called ash insoluble in hydrochloric acid. It is principally constituted of silica and silicates and is often used as a purity index.

Reference: **European Pharmacopoeia, 4th edition, 2002, 2.8.1 p.193.**

3. MATERIAL AND REAGENTS

3.1 Material

- Analytical balance ($\pm 1\text{mg}$),
- Oven heated at $600^{\circ}\text{C} \pm 25^{\circ}\text{C}$,
- Bunsen burner *for sulphated ash*,
- Watch glass *for ash insoluble in hydrochloric acid*,
- Ashless filter *for ash insoluble in hydrochloric acid*,
- Desiccator,
- Refractory crucible.

3.2 Reagents

- Sulfuric acid, H_2SO_4 95% (Sigma-Aldrich, Ref. 77239), or equivalent, *for sulphated ash*
- Hydrochloric acid, HCl ~37% (Carlo Erba, Ref. 403916), or equivalent, *for ash insoluble in hydrochloric acid*
- Distilled water, *technical grade, for ash insoluble in hydrochloric acid*

4. PROCEDURE

4.1 Total ash

- Heat to 600°C a refractory crucible during 30 minutes. Let cool in a desiccator until stable mass and weigh the refractory crucible.
- Unless otherwise stated, weigh accurately 1g of sample in the refractory crucible and let dry out on Bunsen burner for 1h.
- Incinerate the refractory crucible with sample in the oven at 600°C.

Sample must not produce flames during heating.

- Continue incineration until stable mass. After each incineration let cool sample in the desiccator.

NB: If ash contains black particules, take it back with boiling water and filter on an ashless filter. Group the filtrate and ash, evaporate until dryness and incinerate until stable mass.

4.2 Sulphated ash

- Heat to 600°C a refractory crucible during 30 minutes. Let cool in a desiccator until stable mass and weigh the refractory crucible.
- Unless otherwise stated, weigh accurately 1g of sample in the refractory crucible and let dry out on Bunsen burner for 1h.
- Moisten sample with a small amount of sulfuric acid (usually 1ml) and heat gently with Bunsen burner until the sample is thoroughly charred. After cooling, moisten the residue with a small amount of sulfuric acid (usually 1ml), heat gently until white fumes are no longer evolved and heat at 600°C until the residue is completely incinerated.

Sample must not produce flames during heating.

- Continue incineration until stable mass. After each incineration let cool sample in the desiccator.

NB: If the amount of the residue so obtained exceeds the prescribed limit, repeat the moistening with sulfuric acid and heating, as previously, for 30 min. periods until the percentage of residue complies with the prescribed limit.

4.3 Ash insoluble in hydrochloric acid

- Add 15ml of water and 10ml of hydrochloric acid to the refractory crucible used to determine the residue of total ash or sulphated ash..
- Cover the refractory crucible with a watch glass and boil gently during 10 min and let cool.
- Filter the residue on an ashless filter and wash with hot water until the filtrate has a neutral pH.
- Let dry out the filter then incinerate the dry residue until it becomes dark red. Let cool in a desiccator and weigh it.
- Continue the incineration until the final weight is stable.

5. RESULTS

The content of total ash, sulphated ash and ash insoluble in hydrochloric acid corresponds to the ratio between the residue in the refractory crucible and the sample weighed.

$$\text{ASH CONTENT} = \frac{m(\text{residue})}{m(\text{sample})} \times 100$$

With:

- m (residue) = Residue weight contained in the refractory crucible at the end of the procedure used (mg)
m (sample) = Sample weight at the beginning of the procedure used (mg)

CHEMICAL

Valid To: December 31, 2021

Certificate Number: 4669.01

In recognition of the successful completion of the A2LA evaluation process (including an assessment of the laboratory's compliance with the A2LA Food Testing Program Requirements, containing the 2018 "AOAC International Guidelines for Laboratories Performing Microbiological and Chemical Analyses of Foods, Dietary Supplements, and Pharmaceuticals"), accreditation is granted to this laboratory to perform the following types of tests on fruits, vegetables, wines, juice, soil, and foods including those with high fat content, soil and substrates, water, liquid samples, flour of avian origin and superficial samples:

<u>Test</u>	<u>Test Method</u>
Analysis of Multi Residues Pesticides by QuEChERS by HPLC/MS/MS and GC/MS in Vegetables, Fruits and Fruits Products, Wines, Liquid Samples, and High Content Fat Food	IT-SGC-01
Determination of Dithiocarbamate with Carbon Disulfur Generation and GC/MS in Fruits and Fruits Products, Vegetables, Wines, Juices, Soils, and High Content Fat Food	IT-SGC-03
Fast Method to Extraction and Detection of Acrylamide in Cereals, Dried Fruits and Nuts by LC/MS/MS and QuEChERS Method	IT-SGC-19
Fast Method to Extraction and Detection of Mycotoxins in Dried Fruits and Nuts and Ochratoxin in Wine by LC/MS/MS and QuEChERS Method	IT-SGC-11
Fast Method to Polar Pesticides in Vegetables, Fruits and Fruit Products, Wine, and High Content Fat Food by LC/MS/MS	IT-SGC-015

¹ This accreditation covers sample preparation and extraction performed at the main laboratory as well as the satellite laboratory listed below.

¹Avenida 20 de Noviembre # 108, col. Sabina in Villahermosa,
Tabasco, México, cp. 86153

<u>Test</u>	<u>Test Method</u>

Accredited Laboratory

A2LA has accredited

CEIMIC CHILE SPA.

Maipu, Santiago, CHILE

for technical competence in the field of

Chemical Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This laboratory also meets the requirements of A2LA R204 - *Specific Requirements - Food and Pharmaceutical Testing Laboratory Accreditation Program*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated April 2017).

Presented this 18th day of June 2020.

Vice President, Accreditation Services
For the Accreditation Council

62116100	Peach, dried, uncooked
62116200	Peach, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62116220	Peach, dried, cooked, unsweetened
62116230	Peach, dried, cooked, with sugar
62119100	Pear, dried, uncooked

62119200	Pear, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62119220	Pear, dried, cooked, unsweetened
62119230	Pear, dried, cooked, with sugar
62120100	Pineapple, dried
62121100	Plum, rock salt, dried
62122100	Prune, dried, uncooked
62122200	Prune, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62122220	Prune, dried, cooked, unsweetened
62122230	Prune, dried, cooked, with sugar
62125100	Raisins
62125110	Raisins, cooked
62126000	Tamarind pulp, dried, sweetened ("Pulpitas")
63101210	Apple, cooked or canned, with syrup
63101420	Apple, pickled
63103110	Apricot, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63103120	Apricot, cooked or canned, unsweetened, water pack
63103130	Apricot, cooked or canned, in heavy syrup
63103140	Apricot, cooked or canned, in light syrup
63103150	Apricot, cooked or canned, drained solids
63103170	Apricot, cooked or canned, juice pack
63109610	Cantaloupe, frozen (balls)
63115110	Cherries, sweet, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63115120	Cherries, sweet, cooked, unsweetened, water pack
63115130	Cherries, sweet, cooked or canned, in heavy syrup
63115140	Cherries, sweet, cooked or canned, in light syrup
63115150	Cherries, sweet, cooked or canned, drained solids
63115170	Cherries, sweet, cooked or canned, juice pack
63119110	Fig, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63119120	Fig, cooked or canned, unsweetened, water pack
63119130	Fig, cooked or canned, in heavy syrup
63119140	Figs, cooked or canned, in light syrup
63123110	Grapes, seedless, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63123120	Grapes, seedless, cooked or canned, unsweetened, water pack
63123130	Grapes, seedless, cooked or canned, in heavy syrup
63126600	Lychee, cooked or canned, in sugar or syrup
63127610	Honeydew, frozen (balls)
63129020	Mango, pickled
63133100	Papaya, cooked or canned, in sugar or syrup

63135110	Peach, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63135120	Peach, cooked or canned, unsweetened, water pack
63135130	Peach, cooked or canned, in heavy syrup
63135140	Peach, cooked or canned, in light or medium syrup
63135150	Peach, cooked or canned, drained solids
63135170	Peach, cooked or canned, juice pack
63135650	Peach, pickled
63137110	Pear, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63137120	Pear, cooked or canned, unsweetened, water pack
63137130	Pear, cooked or canned, in heavy syrup
63137140	Pear, cooked or canned, in light syrup
63137150	Pear, cooked or canned, drained solids
63137170	Pear, cooked or canned, juice pack
63141110	Pineapple, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63141120	Pineapple, cooked or canned, unsweetened, waterpack
63141130	Pineapple, cooked or canned, in heavy syrup
63141140	Pineapple, cooked or canned, in light syrup
63141150	Pineapple, cooked or canned, drained solids
63141170	Pineapple, cooked or canned, juice pack
63143110	Plum, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63143120	Plum, cooked or canned, unsweetened, water pack
63143130	Plum, cooked or canned, in heavy syrup
63143140	Plum, cooked or canned, in light syrup
63143150	Plum, cooked or canned, drained solids
63143170	Plum, cooked or canned, juice pack
63147110	Rhubarb, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63147120	Rhubarb, cooked or canned, unsweetened
63147130	Rhubarb, cooked or canned, in heavy syrup
63147140	Rhubarb, cooked or canned, in light syrup
63147150	Rhubarb, cooked or canned, drained solids
63201110	Blackberries, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63201130	Blackberries, cooked or canned, in heavy syrup
63203110	Blueberries, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63203120	Blueberries, cooked or canned, unsweetened, water pack
63203125	Blueberries, cooked or canned, in light syrup
63203130	Blueberries, cooked or canned, in heavy syrup
63207000	Cranberries, NS as to raw, cooked, or canned

63207110	Cranberries, cooked or canned

Response to U.S. FDA's Additional Questions Re: GRAS Notice No. 903

1.0 INTRODUCTION

Please see the below responses to the United States (U.S.) Food and Drug Administration's (FDA's) email received on 16 November 2020 pertaining to information provided within Naturex SA's (Naturex's) Generally Recognized as Safe (GRAS) Notice for Quillaia Extract Type 2 filed by the Agency under GRN 903.

2.0 QUESTIONS AND RESPONSES

2.1 Question One

The revised specifications table (Table C4-1) lists a saponin specification of 65 to 75% in the liquid product and >65% in the powder product. However, in the response to Question 8, the notifier indicates that the specification for saponins in the final products can be aligned with the JECFA specification for saponins of 65 to 90%. Please clarify the saponin specification for the final liquid and powder products and provided a revised specification table, as appropriate.

2.1.1 Response to Question One

We apologize for not updating the table of specifications to reflect the decision to align the saponin limits with those in the Joint FAO/WHO Expert Committee on Food Additives (JECFA) specifications. Please find below an updated specification table (see Table 2.1.1-1) with the limits for saponins of 65 to 90% on the dried basis in both the liquid and powder quillaia extract type 2 products, which is in agreement with the limit specified in the JECFA specification.

Table 2.1.1-1 Physical, Chemical, and Microbiological Specifications for Quillaia Extract Type 2

Specification Parameter	Specification		Method
	Naturex (liquid products)	Naturex (powder products)	
Identity			
Appearance	Clear brown or brown liquid	Clear brown or brown powder	Visual
Flavor	Bittersweet	Bittersweet	Sensory testing
Brix	>20	NA	Brix meter
Color/absorbance	2 max absorbance of a 10° Brix @ 520 nm (50% w/w) solution	2 max absorbance of a 10% w/w @ 520 nm	Spectrometry UV
Chemical Specifications			
pH	3.7 to 4.2	3.7 to 4.3	pH meter
Water/loss on drying (%) ^c	50 to 90	NA	I.R. Balance (CQ-MO-018)
Moisture content (%)	NA	<6.00	I.R. Balance (CQ-MO-018)
Saponins (% dwb)	65 to 90	65 to 90	HPLC
Heavy Metals			
Lead (mg/kg)	≤2	≤2	AOAC 999.10

Table 2.1.1-1 Physical, Chemical, and Microbiological Specifications for Quillaia Extract Type 2

Specification Parameter	Specification		Method
	Naturex (liquid products)	Naturex (powder products)	
Mercury (mg/kg)	≤1	≤1	Norma Chilena (NCh) 2667
Cadmium (mg/kg)	≤1	≤1	AOAC 999.11
Arsenic (mg/kg)	≤2	≤2	AOAC 986.15
Microbiological Specifications			
Aerobic plate count (cfu/g or mL)	<100	<100	CQ-MO-231; NF EN ISO 4833
Yeast (cfu/g or mL)	<10	<10	CQ-MO-244; NF V 08-059
Mold (cfu/g or mL)	<10	<10	CQ-MO-244; NF V 08-059

AOAC = Association of Official Analytical Chemists; cfu = colony-forming units; dwb = dry weight basis; HPLC = high-performance liquid chromatography; I.R. = infrared; NA = not applicable; UV = ultraviolet.

^a Internal measure for calculation of parameters with limits on a dry weight basis.

2.2 Question Two

The notifier describes how the critical control point in the manufacture of Quillaia Extract Type 2 (Table 2.2.2-1) controls for the presence of Salmonella serovars (page 12), however, does not provide justification as to why they do not include a specification for Salmonella serovars in Table 2.3.1-1 (page 12). For the administrative record, please describe why Salmonella serovars are not a concern in the final product, and why a specification is not needed.

2.2.1 Response to Question Two

The pasteurization step is conducted to eliminate potential microbiological pathogens in the quillaia extract type 2 product. The identification of *Salmonella* was included to provide an example potential pathogen and the temperature required for its growth inhibition in order to justify the selected pasteurization temperature.

Common food sources of *Salmonella* spp. include vegetables, chicken, pork, fruits, nuts, eggs, beef, and sprouts, while reptiles, amphibians, birds, and pet food and treats are other common sources (FoodSafety.gov, 2019). The raw material for quillaia extract type 2 is wood and/or bark of the Chilean tree *Quillaja saponaria* Molina (family *Rosaceae*), which is not identified as a common source of *Salmonella* spp. Therefore, based on the type of raw material (wood and/or bark), *Salmonella* spp. are not expected to be a common pathogen. Aerobic plate count, yeast, and mold were considered appropriate microbiological controls, and specification limits were established for these parameters. Nonetheless, Naturex also adheres to a control plan, wherein additional microbiological parameters, including *Salmonella* spp., are tested approximately every 6 months. The results from the last 3 testing cycles of quillaia extract type 2 liquid and powder are provided in Table 2.2.1-1 below and demonstrate that no *Salmonella* spp. were detected.

On the basis that *Salmonella* spp. are not expected to be a common pathogen in the raw material, the pasteurization step is sufficient to kill *Salmonella* spp., and that *Salmonella* spp. have not been detected in the periodic tests of liquid and powder lots of quillaia extract type 2, a limit for *Salmonella* spp. in the final product specifications was not considered necessary.

Table 2.2.1-1 Results of *Salmonella* spp. Testing in Quillaia Extract Type 2

Date	<i>Salmonella</i> spp.	
	Quillaia Extract Type 2 Liquid	Quillaia Extract Type 2 Powder
02 September 2019 ^a	Absent in 25 g	Absent in 25 g
21 January 2020 ^a	Absent in 25 g	Absent in 25 g
06 August 2020 ^b	Absent in 25 g	Absent in 25 g

^a *Salmonella* spp. testing was conducted according to Norma Chilena (NCh) 2675.Of2002.

^b *Salmonella* spp. testing was conducted according to VIDAS UP *Salmonella* (SPT) Método AFNOR BIO 12/32-10/11 y AOAC Method 2013.01.

2.3 Question Three

Please clearly state the beginning date of your search for relevant references with respect to the conducted searches note below.

- On pp 25-26 in your response to Toxicology Question 1, you indicate that your updated search was conducted for information available through November 2019 (see text paragraph 2 on pp 25, and Part 2 of Table T1-1). However, the beginning date of the search period (e.g., January 2019) used in your updated literature review was not provided.*
- On pp 22 in your response to Chemistry Question 11, you described your search for literature on background exposure to saponins. However, the beginning date of the search period examined was not provided.*

2.3.1 Response to Question Three

No limits were applied with respect to the beginning date of the update literature search conducted in November 2019 or the literature search for background exposure to saponins conducted in August 2020. As no limits were applied, the program searched the identified databases from inception. For clarity, the inception dates, as well as the frequency with which the databases are updated, are provided in Table 2.3.1-1 below.

Table 2.3.1-1 Details Regarding Electronic Databases Used to Retrieve Literature

Electronic Database	Date of Inception	Update Frequency
Adis Clinical Trials Insight	1990	Weekly
AGRICOLA	1970	Monthly
AGRIS	1975 ^a	Monthly

Table 2.3.1-1 Details Regarding Electronic Databases Used to Retrieve Literature

Electronic Database	Date of Inception	Update Frequency
ToxFile ^a	1900	Daily with annual refresh

^a This database includes publications up to 2016.

2.4 Question Four

In the Response to FDA Questions Toxicology Question 3 on mutagenicity and genotoxicity testing, you reference the “regulatory maximum dose” levels of saponins. Please define the term of “regulatory maximum dose level,” and provide a published reference or resource for the definition and for the associated saponin levels stated. Please also clearly note the “regulatory” agency or authority for which the regulatory maximum dose levels for saponin applies.

2.4.1 Response to Question Four

The term “regulatory maximum dose level” refers to the maximum concentrations or doses recommended in the Organisation for Economic Co-operation and Development (OECD) Test Guidelines (TGs). In retrospect, Naturex recognizes that the OECD is an intergovernmental organization and not a regulatory body; therefore, the term “regulatory maximum dose level” could be more correctly replaced with the wording “OECD maximum recommended dose/concentration” when referring to the studies. The bacterial reverse mutation assay and the *in vivo* mammalian erythrocyte micronucleus test were conducted in accordance with the OECD TG 471 and OECD TG 474, respectively, using the maximum doses (on a saponin basis) established by the OECD and outlined in each respective TG (OECD, 1997, 2016). As discussed in the *Response to FDA Questions Toxicology Question 3*, the concentrations and doses tested were on a saponin basis to ensure a conservative, worst-case exposure to both impurities and saponins and to ensure that the results would be relevant to both the type 1 and type 2 extracts.

In the bacterial reverse mutation assay, the OECD-recommended maximum test concentration is 5 mg/plate or 5 µL/plate (OECD, 1997; see Table 2.4.1-1 below), and the concentrations selected for the main experiments were up to the guideline maximum concentration level of 5 µL saponins/plate [Sequani Limited, 2018a (unpublished)]. This concentration of saponins corresponded to much higher levels of 21.55 µL quillaia extract type 1/plate.

In the *in vivo* mammalian erythrocyte micronucleus test, the OECD-recommended highest dose for an administration period of less than 14 days is 2,000 mg/kg body weight/day (OECD, 2016; see Table 2.4.1-1 below), and rats were dosed by gavage with water (negative control) or quillaia extract type 1 at the maximum dose of 2,000 mg/kg body weight/day saponins [Sequani Limited, 2018b (unpublished)]. This dose corresponds to a much higher dose of 8,620 mg/kg body weight/day of quillaia extract type 1.

Table 2.4.1-1 OECD Maximum Concentration/Dose Levels for the Mutagenicity and Genotoxicity Tests

Test	Maximum Dose or Concentration	Reference
Bacterial reverse mutation test	5 mg/plate or 5 µL/plate	OECD TG 471 (OECD, 1997)
<i>In vivo</i> mammalian erythrocyte micronucleus test	2,000 mg/kg body weight/day	OECD TG 474 (OECD, 2016)

OECD = Organisation for Economic Cooperation and Development; TG = Test Guideline.

Response to U.S. FDA's Additional Questions Re: GRAS Notice No. 903

1.0 INTRODUCTION

Please see the below responses to the United States (U.S.) Food and Drug Administration's (FDA's) email received on 08 January 2021 pertaining to information provided within Naturex SA's (Naturex's) Generally Recognized as Safe (GRAS) Notice for Quillaia Extract Type 2 filed by the Agency under GRN 903.

2.0 QUESTIONS AND RESPONSES

2.1 Question One

The notifier indicated that quillaia extract type 2 (QET2) is intended to be used as an emulsifier in certain food categories and dietary supplements. In addition, the notifier indicated that QET2 would serve a technological purpose in dietary supplements. Please clarify if QET2 is intended to be used as an emulsifier in dietary supplements. In addition, please indicate what the technological purpose is in dietary supplements if it is different from an emulsifier.

2.1.1 Response to Question One

We confirm that QET2 is intended to be used as an emulsifier in dietary supplements and that the technological role of QET2 in dietary supplements is as an emulsifier.

2.2 Question Two

We performed the exposure estimate for saponins from the proposed use of QET2 and the proposed and current uses of QET1 and QET2 using the food codes provided by the notifier and obtained results that were consistent with those provided by the notifier for the food uses. However, this exposure estimate did not include the use of QET2 in dietary supplements. Since QET2 is intended to be used in dietary supplements, the notifier should provide an exposure estimate for the proposed uses of QET2 and the proposed and current uses of QET1 and QET2 for the U.S. population aged 2 years and older including the use of QET2 in dietary supplements. If the notifier did include dietary supplements in their exposure estimate, they should explain how this use was incorporated into the exposure estimate and indicate why there is no change in exposure when this use is included in the exposure estimate.

2.2.1 Response to Question Two

The use of QET2 in dietary supplements was included in the exposure estimates provided previously in Part 3.2.2 of the original GRAS Notice (exposure to saponins from the combined use of QET1 and QET2), Part 3.2.3 of the original GRAS Notice [exposure to QET2 (i.e., the ingredient itself)], and in response to Question 10 from the U.S. FDA's questions dated 23 July 2020 (exposure to saponins from the use of QET2). Please see Annex A for the list of food codes used in the original exposure assessment of QET1 and QET2, which is a duplicate of Annex C that was provided as part of the 23 July 2020 response to FDA's questions. The food codes that were included to represent dietary supplements in the dietary intake assessment for

QET2 are listed under the subheadings “Solid Supplements”, “Liquid Supplements”, and “Botanical Supplements” and begin on page 109 of the attached Annex A.

As part of each intake assessment conducted (as described in the above paragraph), the estimated *per capita* and consumer-only daily intakes from each individual proposed food use category of QET2 were determined for all U.S. population groups. This included the percent contribution of each food category to the total mean dietary intakes of QET2, saponins from QET2, or saponins from QET1 and QET2 (*i.e.*, mean intake from the individual food use as a proportion of the total estimated mean intakes for all food uses). The attached Annex B provides this information for the intakes of saponins from the proposed uses of QET2 for the dietary supplement categories only (from the assessment of saponins from the proposed uses of QET2 only) in individual population groups, while the intakes in the total population (ages 2 and up) are provided below.

Tables 2.2.1-1 and 2.2.1-2 below present the estimated intakes of saponins resulting from the individual dietary supplement types in which QET2 is proposed for use, on an absolute and body weight basis, respectively, for the total population (aged 2 years and older). The estimated mean and 90th percentile daily intakes of saponins from solid, liquid, and botanical supplements among consumers only are up to 0.5 and 0.95 mg/day, respectively, on an absolute basis, and 0.01 and 0.02 mg/kg body weight/day, respectively, on a body weight basis (liquid supplements). Solid, liquid, and botanical supplements each individually contributed $\leq 0.1\%$ to total mean dietary intakes of saponins from QET2 among the total U.S. population aged 2 and up (see Tables 2.2.1-1 and 2.2.1-2 below) and across all population groups except for infants and young children, where liquid supplements were estimated to only contribute up to 0.6% to total mean intakes and female adults, where solid supplements were estimated to contribute 0.2% to total mean intakes (see Annex B for further details on individual population groups).

As such, the Notifier confirms that the intake assessment results which were submitted in the original GRAS Notice and in the response to Question 10 from the U.S. FDA’s questions dated 23 July 2020 included dietary supplements within the total estimated values. The low contribution of dietary supplements to mean total dietary intakes (*i.e.*, ≤ 0.1 to 0.6% across all population groups) explains why the estimated exposure values submitted by the Notifier are aligned with those calculated by the FDA (whereby the assessment did not include these food types) – *i.e.*, there is no impact on total estimated daily exposure to saponins when the proposed food use category of dietary supplements is included in the exposure assessment to saponins from QET2.

Of note, the values presented below and in Annex B represent the estimated daily intakes in the assessment conducted for QET2 only, and not the combined QET1 and QET2 assessment. However, the estimated intakes of saponins from dietary supplements only will be the same in the combined QET1 and QET2 assessment for the following reasons:

- QET1 is not permitted for use in dietary supplements (hence no exposure from QET1);
- QET2 contributes greater than 90% to intakes of saponins from the combined uses of QET1 and QET2; and
- dietary supplements contributed $\leq 0.1\%$ to 0.6% to total mean intakes of saponins from QET2 across all population groups.

Table 2.2.1-1 Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by the Total U.S. Population Ages 2 and Up (2013-2014 NHANES Data)

Food Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	0.03	0.09	46.9	2,878	0.07	0.15
Liquid supplements	<0.1	0.01	na	1.3	90	0.50	0.95
Botanical supplements	<0.1	<0.01*	na	0.3	19	0.07*	0.12*

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table 2.2.1-2 Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by the Total U.S. Population Ages 2 and Up (2013-2014 NHANES Data)

Food Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.01	<0.01	47.1	2,861	<0.01	<0.01
Liquid supplements	<0.1	<0.01	na	1.3	90	0.01	0.02
Botanical supplements	<0.1	<0.01*	na	0.3	19	<0.01*	<0.01*

bw = body weight; n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

27564002	Frankfurter or hot dog sandwich, NFS, plain, on whole wheat bun
27564003	Frankfurter or hot dog sandwich, NFS, plain, on whole grain white bun

27564004 Frankfurter or hot dog sandwich, NFS, plain, on multigrain bun
 27564010 Frankfurter or hot dog sandwich, NFS, plain, on white bread
 27564020 Frankfurter or hot dog sandwich, NFS, plain, on wheat bread
 27564030 Frankfurter or hot dog sandwich, NFS, plain, on whole wheat bread
 27564040 Frankfurter or hot dog sandwich, NFS, plain, on whole grain white bread
 27564050 Frankfurter or hot dog sandwich, NFS, plain, on multigrain bread
 27564060 Frankfurter or hot dog sandwich, beef, plain, on white bun
 27564061 Frankfurter or hot dog sandwich, beef, plain, on wheat bun
 27564062 Frankfurter or hot dog sandwich, beef, plain, on whole wheat bun
 27564063 Frankfurter or hot dog sandwich, beef, plain, on whole grain white bun
 27564064 Frankfurter or hot dog sandwich, beef, plain, on multigrain bun
 27564070 Frankfurter or hot dog sandwich, beef, plain, on white bread
 27564080 Frankfurter or hot dog sandwich, beef, plain, on wheat bread
 27564090 Frankfurter or hot dog sandwich, beef, plain, on whole wheat bread
 27564100 Frankfurter or hot dog sandwich, beef, plain, on whole grain white bread
 27564110 Frankfurter or hot dog sandwich, beef, plain, on multigrain bread
 27564120 Frankfurter or hot dog sandwich, beef and pork, plain, on white bun
 27564121 Frankfurter or hot dog sandwich, beef and pork, plain, on wheat bun
 27564122 Frankfurter or hot dog sandwich, beef and pork, plain, on whole wheat bun
 27564123 Frankfurter or hot dog sandwich, beef and pork, plain, on whole grain white bun
 27564124 Frankfurter or hot dog sandwich, beef and pork, plain, on multigrain bun
 27564130 Frankfurter or hot dog sandwich, beef and pork, plain, on white bread
 27564140 Frankfurter or hot dog sandwich, beef and pork, plain, on wheat bread
 27564150 Frankfurter or hot dog sandwich, beef and pork, plain, on whole wheat bread
 27564160 Frankfurter or hot dog sandwich, beef and pork, plain, on whole grain white bread
 27564170 Frankfurter or hot dog sandwich, beef and pork, plain, on multigrain bread
 27564180 Frankfurter or hot dog sandwich, meat and poultry, plain, on white bun
 27564181 Frankfurter or hot dog sandwich, meat and poultry, plain, on wheat bun
 27564182 Frankfurter or hot dog sandwich, meat and poultry, plain, on whole wheat bun
 27564183 Frankfurter or hot dog sandwich, meat and poultry, plain, on whole grain white bun
 27564184 Frankfurter or hot dog sandwich, meat and poultry, plain, on multigrain bun
 27564190 Frankfurter or hot dog sandwich, meat and poultry, plain, on white bread
 27564200 Frankfurter or hot dog sandwich, meat and poultry, plain, on wheat bread
 27564210 Frankfurter or hot dog sandwich, meat and poultry, plain, on whole wheat bread
 27564220 Frankfurter or hot dog sandwich, meat and poultry, plain, on whole grain white bread
 27564230 Frankfurter or hot dog sandwich, meat and poultry, plain, on multigrain bread
 27564240 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on white bun
 27564241 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on wheat bun
 27564242 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on whole wheat bun
 27564243 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on whole grain white bun
 27564244 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on multigrain bun
 27564250 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on white bread
 27564260 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on wheat bread

27564270 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on whole wheat bread
 27564280 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on whole grain white bread
 27564290 Frankfurter or hot dog sandwich, chicken and/or turkey, plain, on multigrain bread
 27564300 Frankfurter or hot dog sandwich, reduced fat or light, plain, on white bun
 27564301 Frankfurter or hot dog sandwich, reduced fat or light, plain, on wheat bun
 27564302 Frankfurter or hot dog sandwich, reduced fat or light, plain, on whole wheat bun
 27564303 Frankfurter or hot dog sandwich, reduced fat or light, plain, on whole grain white bun
 27564304 Frankfurter or hot dog sandwich, reduced fat or light, plain, on multigrain bun
 27564310 Frankfurter or hot dog sandwich, reduced fat or light, plain, on white bread
 27564320 Frankfurter or hot dog sandwich, reduced fat or light, plain, on wheat bread
 27564330 Frankfurter or hot dog sandwich, reduced fat or light, plain, on whole wheat bread
 27564340 Frankfurter or hot dog sandwich, reduced fat or light, plain, on whole grain white bread
 27564350 Frankfurter or hot dog sandwich, reduced fat or light, plain, on multigrain bread
 27564360 Frankfurter or hot dog sandwich, fat free, plain, on white bun
 27564361 Frankfurter or hot dog sandwich, fat free, plain, on wheat bun
 27564362 Frankfurter or hot dog sandwich, fat free, plain, on whole wheat bun
 27564363 Frankfurter or hot dog sandwich, fat free, plain, on whole grain white bun
 27564364 Frankfurter or hot dog sandwich, fat free, plain, on multigrain bun
 27564370 Frankfurter or hot dog sandwich, fat free, plain, on white bread
 27564380 Frankfurter or hot dog sandwich, fat free, plain, on wheat bread
 27564390 Frankfurter or hot dog sandwich, fat free, plain, on whole wheat bread
 27564400 Frankfurter or hot dog sandwich, fat free, plain, on whole grain white bread
 27564410 Frankfurter or hot dog sandwich, fat free, plain, on multigrain bread
 27564420 Frankfurter or hot dog sandwich, meatless, plain, on bun
 27564430 Frankfurter or hot dog sandwich, meatless, plain, on bread
 27564440 Frankfurter or hot dog sandwich, with chili, on white bun
 27564441 Frankfurter or hot dog sandwich, with chili, on wheat bun
 27564442 Frankfurter or hot dog sandwich, with chili, on whole wheat bun
 27564443 Frankfurter or hot dog sandwich, with chili, on whole grain white bun
 27564444 Frankfurter or hot dog sandwich, with chili, on multigrain bun
 27564450 Frankfurter or hot dog sandwich, with chili, on white bread
 27564460 Frankfurter or hot dog sandwich, with chili, on wheat bread
 27564470 Frankfurter or hot dog sandwich, with chili, on whole wheat bread
 27564480 Frankfurter or hot dog sandwich, with chili, on whole grain white bread
 27564490 Frankfurter or hot dog sandwich, with chili, on multigrain bread
 27564500 Frankfurter or hot dog sandwich, with meatless chili, on white bun
 27564501 Frankfurter or hot dog sandwich, with meatless chili, on wheat bun
 27564502 Frankfurter or hot dog sandwich, with meatless chili, on whole wheat bun
 27564503 Frankfurter or hot dog sandwich, with meatless chili, on whole grain white bun
 27564504 Frankfurter or hot dog sandwich, with meatless chili, on multigrain bun
 27564510 Frankfurter or hot dog sandwich, with meatless chili, on white bread
 27564520 Frankfurter or hot dog sandwich, with meatless chili, on wheat bread
 27564530 Frankfurter or hot dog sandwich, with meatless chili, on whole wheat bread

- 27564540 Frankfurter or hot dog sandwich, with meatless chili, on whole grain white bread
- 27564550 Frankfurter or hot dog sandwich, with meatless chili, on multigrain bread
- 27564560 Frankfurter or hot dog sandwich, meatless, on bun, with meatless chili
- 27564570 Frankfurter or hot dog sandwich, meatless, on bread, with meatless chili
- 27570310 Hors d'oeuvres, with spread

Milk Products

[Quillaia] = 0.1 mg/100 g

62101100	Apple, dried, uncooked
62101200	Apple, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62101220	Apple, dried, cooked, unsweetened
62101230	Apple, dried, cooked, with sugar
62101300	Apple chips
62104100	Apricot, dried, uncooked
62104200	Apricot, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62104220	Apricot, dried, cooked, unsweetened
62104230	Apricot, dried, cooked, with sugar
62105000	Blueberries, dried
62106000	Cherries, dried
62107100	Banana flakes, dehydrated
62107200	Banana chips
62108100	Currants, dried
62109100	Cranberries, dried
62110100	Date
62113100	Fig, dried, uncooked
62113200	Fig, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62113220	Fig, dried, cooked, unsweetened
62113230	Fig, dried, cooked, with sugar
62114000	Lychee, dried (lychee nuts)
62114050	Mango, dried
62114110	Papaya, dried
62116100	Peach, dried, uncooked
62116200	Peach, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62116220	Peach, dried, cooked, unsweetened
62116230	Peach, dried, cooked, with sugar
62119100	Pear, dried, uncooked

62119200	Pear, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62119220	Pear, dried, cooked, unsweetened
62119230	Pear, dried, cooked, with sugar
62120100	Pineapple, dried
62121100	Plum, rock salt, dried
62122100	Prune, dried, uncooked
62122200	Prune, dried, cooked, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
62122220	Prune, dried, cooked, unsweetened
62122230	Prune, dried, cooked, with sugar
62125100	Raisins
62125110	Raisins, cooked
62126000	Tamarind pulp, dried, sweetened ("Pulpitas")
63101210	Apple, cooked or canned, with syrup
63101420	Apple, pickled
63103110	Apricot, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63103120	Apricot, cooked or canned, unsweetened, water pack
63103130	Apricot, cooked or canned, in heavy syrup
63103140	Apricot, cooked or canned, in light syrup
63103150	Apricot, cooked or canned, drained solids
63103170	Apricot, cooked or canned, juice pack
63109610	Cantaloupe, frozen (balls)
63115110	Cherries, sweet, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63115120	Cherries, sweet, cooked, unsweetened, water pack
63115130	Cherries, sweet, cooked or canned, in heavy syrup
63115140	Cherries, sweet, cooked or canned, in light syrup
63115150	Cherries, sweet, cooked or canned, drained solids
63115170	Cherries, sweet, cooked or canned, juice pack
63119110	Fig, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63119120	Fig, cooked or canned, unsweetened, water pack
63119130	Fig, cooked or canned, in heavy syrup
63119140	Figs, cooked or canned, in light syrup
63123110	Grapes, seedless, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63123120	Grapes, seedless, cooked or canned, unsweetened, water pack
63123130	Grapes, seedless, cooked or canned, in heavy syrup
63126600	Lychee, cooked or canned, in sugar or syrup
63127610	Honeydew, frozen (balls)
63129020	Mango, pickled
63133100	Papaya, cooked or canned, in sugar or syrup

63135110	Peach, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63135120	Peach, cooked or canned, unsweetened, water pack
63135130	Peach, cooked or canned, in heavy syrup
63135140	Peach, cooked or canned, in light or medium syrup
63135150	Peach, cooked or canned, drained solids
63135170	Peach, cooked or canned, juice pack
63135650	Peach, pickled
63137110	Pear, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63137120	Pear, cooked or canned, unsweetened, water pack
63137130	Pear, cooked or canned, in heavy syrup
63137140	Pear, cooked or canned, in light syrup
63137150	Pear, cooked or canned, drained solids
63137170	Pear, cooked or canned, juice pack
63141110	Pineapple, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63141120	Pineapple, cooked or canned, unsweetened, waterpack
63141130	Pineapple, cooked or canned, in heavy syrup
63141140	Pineapple, cooked or canned, in light syrup
63141150	Pineapple, cooked or canned, drained solids
63141170	Pineapple, cooked or canned, juice pack
63143110	Plum, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63143120	Plum, cooked or canned, unsweetened, water pack
63143130	Plum, cooked or canned, in heavy syrup
63143140	Plum, cooked or canned, in light syrup
63143150	Plum, cooked or canned, drained solids
63143170	Plum, cooked or canned, juice pack
63147110	Rhubarb, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener
63147120	Rhubarb, cooked or canned, unsweetened
63147130	Rhubarb, cooked or canned, in heavy syrup
63147140	Rhubarb, cooked or canned, in light syrup
63147150	Rhubarb, cooked or canned, drained solids
63201110	Blackberries, cooked or canned, NS as to sweetened or unsweetened; sweetened, NS as to type of sweetener

ANNEX B

Estimated Intakes from Dietary Supplements in Individual Population Groups

Section A

Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Different Population Groups within the U.S. (2013-2014 NHANES Data)

Table A-1 **Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Infants and Young Children Aged Up to 3 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	<0.1	<0.1	<0.1	16.4	83	<0.1	<0.1
Liquid supplements	0.5	<0.1	na	8.7	66	0.4	0.8*
Botanical supplements	0	0	0	0	0	0	0

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table A-2 Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Children Aged 3 to 11 Years within the U.S. (2013-2014 NHANES Data)

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.1	<0.1	36.2	404	<0.1	0.1
Liquid supplements	<0.1	<0.1*	na	0.3	7	0.6*	0.9*
Botanical supplements	<0.1	<0.1*	na	<0.1	2	0.1*	0.1*

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table A-3 **Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Female Teenagers Aged 12 to 19 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	<0.1	<0.1	<0.1	22.3	102	<0.1	0.1
Liquid supplements	<0.1	<0.1*	na	1.5	6	0.3*	0.7*
Botanical supplements	0	0	0	0	0	0	0

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table A-4 **Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Male Teenagers Aged 12 to 19 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	<0.1	<0.1	<0.1	21.6	97	<0.1	0.1
Liquid supplements	0	0	0	0	0	0	0
Botanical supplements	0	0	0	0	0	0	0

n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

Table A-5 Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Female Adults Aged 20 Years and Over within the U.S. (2013-2014 NHANES Data)

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.2	<0.1	0.1	58.0	1,322	0.1	0.2
Liquid supplements	<0.1	<0.1	na	1.5	37	0.5	0.9*
Botanical supplements	<0.1	<0.1*	na	0.4	9	0.1*	0.1*

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table A-6 **Estimated Daily Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Male Adults Aged 20 Years and Over within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/day)		Consumer-Only Intake (mg/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.1	0.1	46.5	901	0.1	0.2
Liquid supplements	<0.1	<0.1*	na	1.2	28	0.6*	1.1*
Botanical supplements	<0.1	<0.1*	na	0.4	8	0.1*	0.1*

n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Section B

Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Different Population Groups within the U.S. (2013-2014 NHANES Data)

Table B-1 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Infants and Young Children Aged Up to 3 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.01	<0.01	16.5	83	<0.01	<0.01
Liquid supplements	0.6	<0.01	na	8.8	66	0.04	0.07*
Botanical supplements	0	0	0	0	0	0	0

bw = body weight; n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table B-2 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Children Aged 3 to 11 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.01	<0.01	36.5	402	<0.01	<0.01
Liquid supplements	<0.1	<0.01*	na	0.3	7	0.03*	0.05*
Botanical supplements	<0.1	<0.01*	na	<0.1	2	<0.01*	<0.01*

bw = body weight; n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table B-3 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Female Teenagers Aged 12 to 19 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	<0.1	<0.01	<0.01	22	99	<0.01	<0.01
Liquid supplements	<0.1	<0.01*	na	1.5	6	<0.01*	0.01*
Botanical supplements	0	0	0	0	0	0	0

bw = body weight; n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table B-4 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Male Teenagers Aged 12 to 19 Years within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	<0.1	<0.01	<0.01	21.8	97	<0.01	<0.01
Liquid supplements	0	0	0	0	0	0	0
Botanical supplements	0	0	0	0	0	0	0

bw = body weight; n = sample size; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

Table B-5 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Female Adults Aged 20 Years and Over within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.2	<0.01	<0.01	58.0	1,313	<0.01	<0.01
Liquid supplements	<0.1	<0.01	na	1.6	37	0.01	0.01*
Botanical supplements	<0.1	<0.01*	na	0.4	9	<0.01*	<0.01*

bw = body weight; n = sample size; na = not available; NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).

Table B-6 **Estimated Daily Per Kilogram Body Weight Intake of Quillaia Extract Type 2, as Saponins, from Individual Proposed Uses in Dietary Supplements by Male Adults Aged 20 Years and Over within the U.S. (2013-2014 NHANES Data)**

Food-Use Category	% Contribution to Total ^a Mean Intake	Per Capita Intake (mg/kg bw/day)		Consumer-Only Intake (mg/kg bw/day)			
		Mean	90 th Percentile	%	n	Mean	90 th Percentile
Solid supplements	0.1	<0.01	<0.01	46.8	898	<0.01	<0.01
Liquid supplements	<0.1	<0.01*	na	1.2	28	0.01*	0.01*
Botanical supplements	<0.1	<0.01*	na	0.4	8	<0.01*	<0.01*

bw = body weight; n = sample size; na = not available NHANES = National Health and Nutrition Examination Survey; U.S. = United States.

^a All dietary sources (including food and beverages).

* Indicates an intake estimate that may not be statistically reliable, as the sample size does not meet the minimum reporting requirements (mean n<30; P90 n<80).
